Doug -

Couple of NOS sources you should check.

1. Leeds Radio/Electronics in Brooklyn, NY
Many old parts from NYC Old Radio Row (they use to be located on Vessey -
before WTC built in 1960s forced radio Row out of area)

2. Abbatron / H.H. Smith (now located in Meadville, PA - western PA)
[Allied Electronics; Newark are 2 distributors]
http://www.abbatron.com/distributors.php

Look at their Metal binding posts - either 8-32 or 10-32 (fine thread).
http://www.abbatron.com/products/part/get/ppj_ibn_meta

Spring loaded binding posts
http://www.abbatron.com/products/part/get/ppj_ibn_sprl

Old style knob binding posts
http://www.abbatron.com/products/part/get/ppj_ibn_knob

For the phenolic ... you can use PC board (fiberglass) or modern
plastics(Lexan) in this thickness in a variety of colors from either hobby
store
or glass companies (what you need is scrap to glass companies)

Hallicrafters SX-28 Super Skyrider
http://oak.cats.ohiou.edu/~postr/bapix/SX28.html

Send an e-mail to Phil Nelson at Phil's old radios
http://antiqueradio.org/halli12.htm

http://antiqueradio.org/SX-28Gearbox.htm

http://xoomer.virgilio.it/egirland/sx28/restor-log/restoration%20log.html

http://www.tuberadio.com/sx28/sx28.html

Folks,

I got one mike with such model number (MK0019) which has a transistor
preamplifier. (It is marked Harris).

Does anyone have a copy of the specs and connections????
Thanks

jon, ea2sn
==========
Jon -

Shure Corporation, located in Evanston, IL (just up the road from my QTH)
has almost all of their product documents on their Internet web site (they
are very good about their support).

I find NO reference on the web site to a Shure model number MK0019
Do you have the correct number? Most Shure microphones do not have
pre-amplifiers inside of them.

Shure Discontinued User Guides and Specification Sheets (Adobe Acrobat
files)

4. Whats been done to these? - BC453, BC455

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-01-01 09:40:43 UTC
From: Andrew VK3BFA <ablight@alphalink.com.au>
Message-ID: <1136108443.072721.227790@g47g2000cwa.googlegroups.com>
Source record: 14455

Hi All,
I recently was given two "Command" receivers from a sk estate, and would like to get them going (restoration would be a bit tooo ambitious - too many extra holes, mods, hacks). This is my first "vintage" project, and would welcome comment on the following (to me) weird points.

They were bolted together (literally) a BC453 (190Khz to 550Khz) and a BC455 (6 to 9.1Mhz).The hf one fed the LF one, the BC453 being used presumably as a "tunable IF - well and good, except that

The 2nd and 3rd IF transformers on the BC455 had been replaced with ones marked "85Khz" - the first IF/Converter one was 2.83 Mhz, which is how it was meant to be. Given that the BC453 wouldnt tune EITHER of these 2 "IF" frequencies, something radical has been done to them!

My question - was this some sort of popular surplus conversion - does anyone have any idea on how to un-do this butchery - I dont have "spare" 2.83Mhz if cans, so.....am I better of trying to do something with these, or throwing them back into storage until I find something thats a more realistic prospect of repair, and keeping these for spare parts?

I do have the AN/ARC5 manual on my PC, in djvu format - Its cumbersome, to say the least - not searchable, and at 350 pages, too big to print out. Any "quick and simple" guides to these things?

Oh, and BTW - the tube mix is all over the place, all 6 volts, one IF replaced by a 6AC7 - most of the rest unreadable due age etc. And a 6F6 on the BC453 as an audio output tube...

Help!!!!

de VK3BFA Andrew.

5. FS - HP Test Equipment

Message-ID: <Ib2dnUphxaiqUCrenZ2dnUVZ_vydnZ2d@adelphia.com>
Source record: 14456

I have exceptional condition HP 608E and an HP/Boonton 202H signal generators, etc. Owing to a planned move later this year, and unfortunately I simply must limit the amount of shop test equipment that I take (no basements where we're going). Either/both of the generators can be picked-up in the MD-VA-DC area for $25 each. Also have an HP 3300A/3400A sweep/function generator for $35, as-new Lampkin deviation meter $40, SG-677/U HF/VHF/UHF sweep generator w/cover $60. Also have a nice HP 606A that I'll accept an offer for. I'm keeping two 8640's and a URM-25D... but I still like the '606! Prices are cheap, I'm just trying to get a little something for these really nice pieces of gear. I'll also probably listing some collector-grade BA's, shortly. Again, I'm located in MD/DC area.
Thanks de Jeep/K3HVG

Shure is _really_ good about docs on this stuff. Look on shure.com under "discontinued products." If it's not there, send them an e-mail and they will usually put it up within a week or two.

If only EV were still half as good...

Hello All,

I help out in a radio museum in Christchurch, New Zealand. We have just acquired a Bosh 636 Automotive Wireless (1938 ?) and I am hoping that someone in this group can point me at any information about this unit. Any pointers or help appreciated.

Any ideas of a more appropriate group about technical stuff for old car radios ?

Thanks,

Mark.

I need to replace an oscilloscope that has gone to the Great Test Bench
in the sky.

What Tektronix scope do you prefer?

I have always like the 7000 series...would you recommend these or
another series?

Thanks

TMT

I use the new Tek DPO scopes for most work, but keep 7904 (500MHz) with
high speed plug-ins and samplers for the times I need analog.

You can get 7k scopes for almost nothing. The DPOs will cost a bunch.

Steve.

The 7000 series is hard to beat. It's stable, it's not that hard to
work on, and there are plenty of useful plug-ins available at reasonable
prices.

That said, I still have a 545 on my bench at work. The calibration contract
just went over to a new company and the new cal guys aren't really sure what
to make of it....

Goodness. I had to get rid of a couple of 545s years ago (no room to keep them
).

My current scope at home is a 465. Basic but nice.

Graham

Scott -

Both E-V and Turner were very good about this .. but they were both
purchased by Telex, not a company known for great after sales support.

~~~~~~

Depends on what you want to use it for.

If you want an older, inexpensive, general purpose 100 Mhz scope, I
think the 465B (not the 465) was the best Tek ever made. They sold for
about $2500 back in the '70s and were worth every penny.

Ok, I'm a bit prejudiced because I worked on the production line for
both models for three years, testing and calibrating. In that time I
did about 2000 of them.

They have been out of production for more than 20 years now, but a
good one can still be had. Shop around. Tek built them to last.

73, Bill W6WRT

p.s. Actual quote from a Tektronix customer: "I gave my purchasing
people instructions that they can buy any kind of scope they want, as
long as they are blue and come from Beaverton, Oregon."

I finally sold off my great Tek 475 and picked up a Tek 2440 -- nice to
be able to "save" the display and then be able to make measurements on
the signal at your leisure. Especially nice when looking at the slew
rate of the slower op-amps.

Do you prefer Analog or Digital? Do you have room for an old tube
mainframe scope, or prefer a "portable"?

I have a Tek 454 that I got at a company auction years back where
I used to work (paid $150 for it). The 453,453A,454, 454A series
are easy to work on, and parts are available from many sources
(the nuvistor tubes in the front end and the tunnel diodes in
the sweep circuits can be a bit hard to find, but are available).
The 485 is a look a like that is all solid state with higher BW
but many do not consider it as good a scope design. I would not
turn one away if it were cheap enough though, when working they
do a good job.

The 453,454,485 scopes have a good CRT that will give years of
service. I've been told that the 465-475 series (larger tube)
will suffer from CRT burn-out eventually, the 453-454-485 scopes
rarely need a new crt. (The company where I got the scope from
had bought spare parts to keep all their scopes going, they NEVER
replaced a 453-454 crt but used up all their 465-475 crt spares).

Tek 475.
I have fancier scopes that do fancy stuff, but the 475 is an all-time
classic par excellence. I love it so much I also use it as a
decorative centrepiece for the dining room table.

I have an old Harris xcvr and it has Shure MK0009 microphone. I did not find
it in the discontinued list

Until last month I'd treasured my Tek 7633. Cost the eqiv' of only $60, yet
gave 5 years continuous, unremitting, troublefree service. Lovely bit of
kit. Looked right, felt right and offered a vast, soul pleasing array of
buttons and knobs.
Switched on with the fan purring away, I knew that I was at one with the
world.
Sadly, the display character generator started to fail. Even bought a
service manual and had a poke about. Joy was not to be, a Tek chip was
giving up the ghost. I knew then it's life was drawing to an honourable
close and another Tek scope would have to be sought.
I'd previously fancied the more modern Tek 2445, so downloaded a service
manual.
Shock-horror!, perusal of the circuitry revealed that there is nothing in
them other than a few special Tek chips.
Ended up buying a 100MHz Hitachi scope (equiv of $160). It does much more
than my old Tek, having benefit of modern uP aided cursors and measurements
etc. It's also smaller, lighter and repairable.
I love using it but I can't help feeling there's something missing that's
really crucial. Something that raises an instrument from the status of
'nice' to that of 'beloved'. (probably the Tek fan :).
Obviously I need to get out more.
regards
john

I would like to buy the 146.20 / 146.80 pair of crystals
for a Heath HW-202.

The xtals are probably the standard used in many rigs (rcvr has
10.7 Mc IF; xmtr mutiplication factor is x24).

I've got a 2445, which I've had for about six years. It was the first equipment purchase made when I started a new job; it was purchased reconditioned from Tucker. I inherited the scope when that employer went bankrupt. I enjoy it very much, but need storage... I have a TDS210 (same provenance) which is pretty good, but I lust after the HP scope I have at work, which has two analog channels and 16 digital channels, and LOADS of memory... *sigh*. So many projects, so little time and money :)

I have used a 7603 for about 15 years for general troubleshooting, and it's my favorite scope. It's rock solid, and bright and sharp. I haven't been able to find a horiz plug-in with TV sync, but the trigger is so good I can get it to lock on video anyway. Only problems are the huge Mallory capacitors in the power supply that will open without warning. Replace all of these and you'll have no trouble at all.

John

Here is a link to the Tek forun on Yahoo,
lots of great info on new and older models.

perhaps you can make a few bucks parting
out the older scope.

7104 is an even nicer analog scope, with its phenomenal writing rate.

A used 11801 or 11802 and a sampling head will get you a 12 or 20 GHz
dual-trace digital scope for under $2K, a *much* nicer sampling system
than the 7000-series stuff.

My everyday scope is a TDS2012, which is great for most things. You
can take beautiful photos of the color screen for engr notes, manuals,
or test procedures.

Great plugin: 7A22 (or 1A7A, for the 547) which has switchable
bandwidth and differential input down to 10 uV/cm.

John

My favorite for LF analog work (<200MHz) is the is the Tek TAS485 They
stopped making this, along with all their analog scopes, which is a cryin'
shame, since digital really isn't good for everything.

Yup. Does everything most need from a scope. But in the UK, they still
fetch decent money.

Thanks for the replies so far...they are appreciated.

One feature of the 7000 series that I have appreciated is the plugin capability.

Spectrum analyzer, semiconductor tester, differential amps, etc. all add to its flexibility.

Does anyone have a history of the 7000 series?

Another issue I have seen with the older scopes is at least one can usually repair them....with parts from another parts scope. The newer scopes are reaching the point of throw away status with no parts available and if by chance they are, the price prevents a reasonable repair.

TMT

What you want is the book "Winning with People;The First 40 Years of
Tektronix",by Marshall M.Lee,published by Tektronix,10/86
There's no ISBN number,though.Maybe you can find a copy on Ebay.

It's a fantastic story about Tek from start to the late 1980's.
Unfortunately,it does not cover the decline of Tek.

Hello Bill,
you specifically say "465B (not the 465) was the best Tek ever made"

Can you elaborate a little bit more there Bill. As a Tekscope
enthusiast, I am just interested to know what the improvements
were to the 465B over the 465 to make it more highly sought after.

Regards,
John Crighton

Hello Ken,
I also have a Tek 454. I bought that model
because I read on groups like this that it is "easy"
to work on. I must respectively disagree with you.

My 454 is "not easy" to work on and yet I see people
saying that it is. I am just wondering if you are repeating
what you have read on the internet supporting a Myth
that the 454 is easy to work on or speaking from
practical experience.

I would like to clean the switch wafers of the main
timebase switch. My 454 is put together like an onion.
How do I "easily" gain access to this switch,
which is buried in the heart of the onion?

Slip the covers off your instrument, yes that is
very easy, a matter of seconds. Now have a look
and tell me how to clean the timebase switch?
How many hours would it take to remove the soldered
wiring off the boards so that they can be removed to
gain access to the switch and then solder the wires back
with nice factory quality solder joints, not with quick
blob soldering with insulation peeling back off the wires.
Quality work only.

Several minutes work would be easy if there was
connectors on the boards but not in this scope.
When we talk about "hours" we are in a different
category......pain in the butt/difficult.

How long would it take you, Ken, to clean the switch
from woa to go? Scope back up and working?

How long would it take you to remove the fan, fan wiring
tag strips and fan mounting brackets?
How do you get your screw driver on the screws holding
the brackets when there are modules covering them up?

Just have a quick look then come back and tell me
if you still reckon this scope is easy to work on, in the
inner sanctums.

Regards,
John Crighton

I hope you're giving a hypothetical example, because if
you really do need to "clean" a Tektronix scope switch,
your scope may already be a lost cause. Time to move on.

~~~~~~

In spite of having the number in common, the 465 and 465B are
completely different scopes. Their performance specs are nearly
identical but inside the box, their circuitry is completely different.
The "B" is much easier to calibrate and uses soldered-in transistors
instead of socketed ones, a great advantage especially when the scope
gets old and sockets start to get cranky.

I wouldn't turn down a 465 if that was the only thing available, but
all us calibration techs greatly preferred the 465B.

John is right. Tek scopes are not "easy" to work on, at least not the
solid state ones.

My first day on the job as a 465 calibration tech I went home with a
headache and almost called in the next day and quit. I had done TV
repair for 20 years but had never seen such complicated, unfamiliar
circuitry or construction. Fortunately I stuck it out and came to
appreciate them for what they were: The best scopes in the world.

I have a Yaesu FT-102 HF Transceiver for sale. This one was Malcomized by Mal, NC4L in March of 1997. It has had all of the relays replaced plus other upgrades performed by Mal. It has a CW Filter but no AM/FM Board. Cosmetically it is in good but not mint shape. The cabinet looks good and the front panel is nice. There are some small nicks and scratches mainly on the
trim around the outside of the front panel. It works but has problems. On bands above 20
meters, sensitivity is low as is power output. It loads up to over 100 watts on 20. On 40 meters the VFO does not change frequency. One meter lamp is burned out. Price is $375 plus shipping. No mic or manual. Thanks, Charlie Hugg, K5MBX

~~~~~~

If Tek scopes of that vintage have one Achilles heel, it's the tiny
fork-shaped switch contacts used in many places throughout the unit..

Rarely do they need "cleaning", but rather the contact presssure needs
to be increased slighty. If you know how to do it, it's a quick, easy
fix, but if you don't you can easily destroy the contact.

Because the "fork" of the switch was designed to press against gold
plating, they made the contact pressure as light as possible to
prolong the life of the relatively soft gold. In some cases, it is
just too light and erratic operation is the result.

Here's how to do it right: With a small screwdriver, gently push
against the "U" of the fork, just a tiny amount. The idea is you want
to bend the fork down WITHOUT bending the spring it is attached to.
Under no circumstances try to bend the spring or you will almost
certainly destroy it. Bend only the little gold fork, and bend it only
a very small amount. Done right, it works every time.

Well, it's easy compared to other solid state portable Tek scopes.
Its main advantage is far fewer impossible to find custom parts like
all the later solid state scopes.

Actually this raises the next question that I was going to ask...."What is the easiest Tek scope to work on?"

As I have mentioned before I tend to favor the 5000/7000 line because of the flexibility but my options are open for the next purchase.

I have mentioned that the newer used Tek scopes I have looked into did not seem to have repairability designed into them. I have also heard of more than a few horror stories of parts being unobtainable.

If Tektronix scopes are still as good as I've always known them to be,
then the only consideration should be your budget. Then get the
toppest-of-the-line you can afford.

Have Fun!
Rich

I came across this on the 'net, which may or may not be useful in your
particular case, John...

How to FIX the Fuzzy/Wide Trace on Your Tek 465 or 475 Scope!

Cleaning the Volts/Div Attenuator Switch Contacts in Tektronix 4XX
Oscilloscopes

It might work wonders for your classic Tektronix 400-series scope.
And you can probably do it yourself, even if you've never opened a
scope, before!
(C) Copyright 2004, by Thomas P. Gootee

Here is a copy of the procedure that I sent to a guy with a Tek 475
that had a fuzzy trace, and "distorted" when he adjusted the volts/div
knob. His original email is below, followed by my reply.

--------- Original message --------
From: "Mike D"

To: "tomg@fullnet.com"
Date: 01-30-03 08:41

Do you repair scopes? I have a tek 475 that powers up but is very
fuzzy and distorts when adjusting the volts/division knob.

I don't know if its worth repairing or if you can reccomend a better
scope from your stock for a comparable price.

Thank You

Mike

Mike,

Yes. I do repair *lots* of oscilloscopes. I do it mainly for in-house
instruments that are to be resold. But, I also do it occasionally on a
fee-for-service basis.

The symptoms you describe sound familiar and it sounds like a pretty
easy repair job, which I could complete for $50. However, depending on
your location, if you are in the continental USA, the shipping could
be $20 to $30 or more, each way.

So, let me tell you what I would try first and maybe you can do it
yourself. (I'd hate to see someone spend more than $100 for something
that they might be able to do in less than 30 to 60 minutes.)

Without seeing the scope myself, I could easily be wrong. But, from
your description, my opinion is that, most-likely, the switch contacts
in the volts/div attenuators (and/or also in the trigger-view and
bandwidth-limiter) are dirty or oxidized.

They are very easy to get to and to clean. And, although it might
sound a little daunting to a first-timer, it really isn't difficult at
all, requires only very-basic tools and supplies, and will probably
work wonders for your scope's performance.

Here is the basic procedure:

Unplug the scope and place it on a large, flat, smooth surface, such
as a table or floor.

Remove the scope's case: Start by removing the four screws in the rear
panel's cord-wrap feet. They may be either Phillips-head or "star"
(Torx) types. The feet may come off along with the screws. There are
usually also two other screws, near the top and bottom of the rear
panel, in the center. Remove them, too. After all six of the screws
have been removed, rotate the carry-handle up and out of the way of
the front panel, probably to the "straight up" position.

It is recommended that you stand the scope on its front panel end and
pull the case up and off. But, if you DON'T have a front panel COVER,

you can either try it anyway, hopefully on a padded surface (and carefully!), or else just leave the scope sitting on its feet.

From the rear of the scope, with your fingers on the sides of the case, push on the rear panel with your thumbs. If the scope is not standing on its front panel end, you will need to be very careful, as the scope slides out of the case, to also support the front end, keeping it up, so the bottom front edge of the case does not damage any of the internal parts of the scope by scraping against them.

Note that if the scope's CASE is DENTED, especially if it's dented on a corner-edge, it could be *VERY* difficult to remove the scope from its case! It might then require *QUITE* A BIT of brute force, pushing on the rear panel (or pulling on the edges of the front panel) and pulling on the rear edges (or pushing on the front edges) of the case. (Sometimes, in that situation, it helps to alternate between trying to move the left and right sides; and maybe even also to alternate between moving the top and bottom.)

After the scope is out (whew!), see the note in the next paragraph, and then carefully stand the scope on its SIDE, so that the vertical board, on the side of the scope, behind the v/div knobs, is facing UP.

NOTE! I usually try to lift and move the scope's internal assembly ONLY by the edges of the front panel (or CRT bezel) and rear panel, or other solid structural/steel parts. And be careful not to set the scope on any objects or uneven surfaces that might touch any of the internal components.

Just behind the volts/div knobs, inside the scope, there are two silver, metal "boxes", which house the attenuator/switch assemblies.

Remove all of the necessary screws to open the top of one of the boxes. (Do only one box at a time.)

Inside the box, there are four little rectangular, plastic "attenuator modules", each usually labeled with "somenumber X" (e.g. "4X"). Using a longnose pliers, or something similar (or whatever works), grasp one of them and pull *straight* up, to remove it. I'm not sure if they're static-sensitive, or not. But, just in case they are, I would lay it either on an all-metal part of the scope, or on a piece of aluminum foil, or something like that (i.e. on bare metal), with the pins facing down.

I usually only remove one attenuator module at a time, just so I don't get them mixed up. But you could do two at a time, if it's more convenient (which it often is).

While looking at the area of the circuit board where the attenuator module came from, rotate the corresponding v/div switch back and forth, until you can see which positions raise and lower the tiny gold U-shaped double-contact sets, up and down, from/to the circuit board.

Cut a small piece of clean, white paper, as lint-free as possible, into a thin strip, a little wider than one set of contacts, and long enough for you to handle/manipulate (probably something like three or four inches long and 3/16"-or-so wide?). Do not use cloth, which might snag, or anything abrasive. (You may need to cut new pieces, periodically, as you go through this procedure.)

Turn the volts/div knob, to raise the set of contacts that you're about to clean, up and away from the board.

Carefully slide one end of the paper under the contacts.

Apply a drop or two (or three) of isopropyl (rubbing) alcohol to the paper, under the contacts. It's OK to get it on the contacts, board, etc, too. I assume that the more concentrated the isopropyl is, the better. But I've had good results using the plain 70% drugstore type, and the 90% drugstore type. (The results would probably be even better if you use Caig's "De-Oxit" product, for the cleaning, followed by Caig's "Pro-Gold". They're available at Caig's Website.)

Immediately turn the volts/div switch so that the contacts are lowered against the paper and then (carefully!) pull the paper *straight* out from under the contacts. This should probably be repeated several times for each set of contacts.

Be careful. If you bend the contacts, you may be in trouble. And they are *quite* fragile. But, it should be fine as long as you try to pull the paper as parallel to the board as possible. Certainly, don't ever pull straight *upward* on it, and not even more upward than sideways.

Also, NOTE that a couple of the contact-pairs, the two that are nearest to the front of the scope, are raised and lowered by the AC/GND/DC lever-switch, instead of by the volts/div switch.

When all of the visible contacts have been cleaned that way, replace the attenuator module, carefully, by pushing its pins back into the holes in the circuit board and then pushing it all the way in. (It might not hurt to also clean the attenuator module's pins, although I've never needed to, nor tried to.)

[If you *DO* happen to have some of Caig's "De-Oxit" product, it might be good to apply a tiny amount to each pin of each attenuator block. I usually also apply it to the metal shield, wherever it makes contact with the screws or their mountings (and the the screw-posts/mountings themselves), and wherever the shield makes contact with any other metal surfaces, and also on those metal surfaces themselves. And the screws themselves should also be treated, as should any nearby "ground" screws (i.e. loosen, treat/clean, and re-seat). ALSO, make sure that you treat the grounding "spring" that protrudes up from one of the screws, where the crew touches it, and on its top where it touches the scope's case (and also do that part of the inside of the case). You can often SEE the difference in color of the metal, as the oxidation is removed, especially if you use the concentrated form of De-Oxit that comes in the small plastic "needle-dropper" bottle.]

Replace any attenuator modules that won't be in the way, any more. Then, remove the next attenuator module(s) and repeat the above procedures, until you've gotten to all of the switch contacts in the "box".

When one whole channel's switches are done, replace the metal cover over the attenuator/switch assembly and do the second channel in exactly the same way (or, what the heck, maybe *better*, if that was your first time...). [NOTE that the "fingers" that may be on one side of the shield/box need to go back into the same position that they were in before the top was removed.]

Now that you know what the tiny, gold switch contacts LOOK like, you will be able to much-more-easily find the SIMILAR ones that are on the SAME circuit board, but are toward the REAR of the scope, near the middle of the board. There is no cover over them. So they're MUCH easier to get to. There should be one group of four of them and another group of two of them. Moving the Bandwidth-Limiter and Trigger-View controls, on the front panel, will raise and lower them. Clean them in the same way as described above, for the attenuator switch contacts.

One OTHER thing to check: (I'm not sure, at the moment, if this is only for the 465 model, or if it also applies to the 475:) JUST behind the metal attenuator/switch shield "boxes", there may be a screw that connects a metal piece of the box/shield to the circuit board. If that screw is loose (which I have seen on about a third of the 465 scopes I've worked on!), or if it doesn't make good contact, you may see very noticeable effects in the trace(s), such as fuzziness or distortion, and may see trace-distortion effects when adjusting the trigger-level control (possibly especially-so at the highest frequencies), and possibly other triggering problems.

If cleaning the switch contacts doesn't fix the problems you're having with the "fuzzy" or wide trace, and the attenuator switch anomalies, further diagnosis and repair may be necessary.

Let me know if you try this, and how it works. If you would still like me to work on your scope, just let me know.

And let me know if I can be of more help.

Thanks again!

Best regards,

Tom

"Yeah, the 7000's make great boat anchors too ;) "

Actually the size has never bothered me.

If you look at the footprint a 7000 series scope takes and then compare
it to the space taken up by a supposely "portable" Tek scope, there is
little difference.

Also since my scope rarely leaves my test bench, the weight difference
(which is small) does not matter.

What does matter is dependability, reliability and cost....all factors
that the newer Tek scopes seem to fail at.

Jon Iza also has a Shure "MK" series microphone, and will place a
documentation request to Shure. You can e-mail Shure to request a user's
guide or product sheet for your microphone, if desired.

Shure produces microphones for OEM (e.g. Harris) and military/gov't
contracts.
Contractual agreements can have "do not provide" or equivalent
requirements - in which case Shure would have to honor such clauses.

Seconded. That microchannel plate CRT is a thing of great beauty. I used to use one with the Polaroid film plate on the front when I was a grad student.

They had a pretty nice analog storage scope whose number I forget--it was a portable and looked a lot like a 485.

I have an 11801A that I use all the time, with the 40 GHz sampling head. I got it for about a fifth of the cost of the overpriced modern version.

LeCroy is selling a 100 GHz sampling scope, which uses the Picosecond Pulse Labs 100 GHz sampler. Used to be that LeCroy made nice user interfaces but couldn't build a vertical amplifier to save their lives.

Cheers,

Phil Hobbs

In the 1960s Tek did sell a switch servicing kit for the
large dog kennel size 500 series models with wafer
style rotary switches. I remember a pouch containing
several bightly coloured pencil sized applicators of oil,
grease and various cleaning fluids.

"Time to move on" Oh no! I would never get rid of an
instrument for the want of a bit of effort. My 454 is now on
the reserve bench as back up scope number 3 behind a
couple of 465 scopes. My 454 has a nice clip on metal
cover to protect the front panel. This is the scope I am
more comfortable with lending to friends, knowing that
the front panel is not going to get bashed in transit in the
back of a car.

The slight intermittent problem with the timebase switch
is minor, I can live with that. My 454 from the late 60s
has big wafer switches just like the big 500 series scopes
so cleaning these big wafer switches is easy providing
you can get access to them. Access is the problem
in the 454.

Bill Turner mentioned the U shaped contacts in the
465. Yes that was tricky tending to them but they
are getatable. I would never dump a piece of test

gear because of dodgy switches. I just don't have
the heart to dump any test equipment. I should try
and be stronger but I can't. Being a test equipment
nut is a life crippling disease. :-)

Everything is relative. If you think the 454 is hard to work on, you should
just SEE the insides of the 7000. Likewise the 7000 is a whole lot easier
to work on than the latest generation of digital scopes.

>I would like to clean the switch wafers of the main

If the switch wafers really are bad, the easiest thing to do is to use
Cramolin with a very long spray tube. You can get it into very small
places without having to do as much dissasembly. But make sure the
contacts are tight, first. I don't see contact cleaning needed on
the scopes of this era, although some of the older ones did.

I'm still mad at Walter for a dirty trick he pulled about 20 years
ago. I built an ff&f equivalent of his 4208 Camac 1 ns TDC module, at
a customer's request. So he cut his price in half the next time he
bid, specifically to kill me. The customer, bless his heart,
disqualified LeCroy on "technical grounds."

Depends on your needs, bandwidth, sensitivity, etc.

But for a generic all-purpose Tektronix scope you cannot beat the
7603.

Bill,
The R-278, part of the GRC-27, if my memory serves me. The GRC-27 consists of a transmitter, receiver, and modulator/power supply in a large vertical cabinet. It weighs a ton... or more.. hi! The receiver is neither rare nor desirable, per se. The receiver is of the older ilk of UHF military receivers. It only has 100kHz channel spacing from 225-399.0MHz. The later equipment has channel spacing of either 50kHz or (as the current eqpt does)25kHz spacing. I suppose if one were to be resurrecting a mobile control tower or the like, one might want one of these. Again, though, its only one part of the actual radio set.
That's my take on it. Having said the above, I had one "on the air" a number of years ago that I got from the AF MARS program. It was impressive to demo it to friends but that's about all. I would imagine, however, that the "compleat collector" would need to have one of these!

On the basic Tektronix thread, I still have this Tek 650HR with a luminance problem. It appears to be the "PLRT INV & TRIG PICK-OFF" chip, which is a Tektronix 155-0216-00. Earlier revisions used a Tektronix 155-0032-00.

Tek says support for the monitor (and probably for the rest of the Group 26 products) was discontinued in 1996. They can't tell me what the original manufacturer's part number is, or even who the original manufacturer of the chip was, and the service manual lists only the house number.

Any Tek technicians happen to have some of these in the junk box, or know what the real part number is? The input that takes the base comparison voltage from the aperture pot is pulling the input way down.

I've had that happen once. A competing company with nearly 20 staff
quoted 1/3 what I quoted for a design job.

The potential customer said, "Something's fishy", and gave the
contract to me.

Parts with numbers beginning with 155 are Tek designed and made - they had their own IC design and production facility. So that's the "real" part number. I don't know of any Tek made ICs for which anyone else makes an even roughly equivalent part -- if they did, Tek would have bought them instead of designing and manufacturing their own, which cost a small fortune.

Well, there were a lot of them made. But they aren't really very useful
for anything, so you don't see a lot of them on the ham market.

If you're into the UHF thing, there are plenty of better receivers out
there, which for the most part don't fetch very much money.

> is the easiest Tek scope to work on?"

T921/22 or T932/35,hands down.

No TEK-made ICs,simple switches,low parts count,all solid-state.
(excluding CRT,of course)
Easy to access all parts of the scope,better than any other TEK scope..

Just do not plan on repairing or calibrating them yourself.
Their "service manuals" have NO component-level schematics or parts lists.
Calibrations are done by PC-based software,and may call for test equipment
you don't have. Power supplies are purchased-parts.

The TDS scopes are engineered to be module-exchange repair only.

155-xxxx-xx and 234-xxxx-xx ICs were made **BY TEK**(they should have told
you that),and they sold off the IC manufacturing unit to Maxim,who turned
around and stopped making them,as TEK did not buy in the volumes Maxim
wanted.

NO other company makes those 155 or 234 prefixed ICs.

>

The one good thing is that the 155-0032-xx was used in a lot of TEK
products.You can find them in 465's,IIRC,on the trigger PCB.
Try Ebay,or search electronic salvage companies that sell used TEK
products.

I worked for TEK for 21.5 years as a service tech in their field
offices,repairing and calibrating scopes,TM500,and TV test equipment.

I am looking for a schematic for a Collins 18 S-4. It is apparently a 10 channel 100 Watt tranceiver that was used in aircraft. I have two of them that have had the dyno's removed. They look pretty hefty with an 813 modulated for AM by a pair of 811A's. They have a removable cover on the front to manually change channels. It is simply a rotary switch with a screwdriver slot.

The only source I found wants $75.00 for a manual for what is probably a $10.00 radio.

Thanks all

Yes I agree everything is relative. An easy to repair
comment should be defined a bit better, perhaps
against time or compared against something else
say removing a hard drive from a home conputer.
Half a dozen screws and the cover is off,
Pull two connectors and remove two or four
mounting screws and the hard drive is out.
I would call that easy.
A job that takes less that 15 minutes I would say is easy.

I must admit I have never come across Cramolin. I will
ask around. If it is available in Sydney, I'll find it.

> I don't see contact cleaning needed on
>the scopes of this era, although some of the older ones did.
>--scott

Oh, I do!
Going by the dates on the boards, I am guessing that
my 454 was built around 1968 and has spent many

years in someones backyard tin shed. The aluminium metal work is slightly pitted meaning it has been in a damp area. There was no filter for who knows how long, one or two decades maybe longer, so the insides are quite dusty.

Two years shy of forty years of age and the scope still works. Bloody marvellous! Switches in that environment of damp and dust can't be expected to remain clean and reliable. I am just amazed that my 454 scope works as well as it does even with its dodgy switch.

Regards,
John Crighton
Sydney

My comment was based on what I have read. I have the service manual
for the 454 and it is a well written book. The 454 is a a well designed
scope, and parts are available. Fixing ANY high tech scope is NOT a job
for the faint of heart, but at least the parts in the 454 are not
so small (surface mount) that you need an electron microscope to see them!
The older tube based tek's are what you want if you want to restore a
scope yourself. However, if you want to buy a scope in working condition
that you COULD fix yourself (OK substitute the word POSSIBLE for EASY) then
the 45x series is about as "modern" as you want to go.

I just tracked down an intermittent in my 2467B's CRT supply, a process
that would have been a lot tougher if I hadn't had both my 485 and 2430A
clipped to various points. Scopes are cheap these days... you want at
least three.

Fred,
Maybe I can help. My father was a field engineer for Collins Radio from 1952 to 1955 and worked with the 18 S transmitter/receiver and 180 L antenna tuner.

I have saved things from those days for sentimental reasons. Turns out, I have two copies of the 18S-4 instruction book. I thought it was just an operators manual, but it's almost a half inch thick, and does have a schematic of the set and parts list and pretty good pictures. It's a second revision dated November 1953.

I don't need two copies, so I'll bet we can make a deal that will at least give you some place to start without you spending your life's savings. I'll bet Art Collins would turn over in his grave if he heard you call his 18S-4 a "ten dollar radio".

Of interest is where did you acquire these units?

John

Ken,
Remove the covers from your 454 scope and take a look
from the point of view of access to the inner assemblies.
I wonder if you still say that it is well designed?.
Deliberately threading bunches of wires (small loom) through
round holes in brackets or sub panels is weird. Why not slot holes
to the end of brackets/ sub assemblies/metal panels so that
the cable loom or wires can be slipped out of the slot if a
subassembly has to be moved. Threading wires through round
holes in small bits of metalwork so that they are tied in, I don't
like that sort of design.
No thought for the non Tek trained serviceman.

>that you COULD fix yourself (OK substitute the word POSSIBLE for EASY) then
>the 45x series is about as "modern" as you want to go.

I settled on the 465 myself. The first was a goer with problems.
The little U shaped contacts that Bill Turner spoke off.
The second was cosmetically very nice but dead. Shorted tantalum
on the 15V suppluy.
The third was partly robbed of bits. Even had an IC fitted
back to front.

All three are working nicely now. I enjoyed repairing them.
You can get access to most of the 465s innermost parts. Not
a nightmare like the the 454 and yet the 454 gets a great right
up on many websites. I don't know why!
Sorry Ken if I appeared to jump on you.

In regard to the old tube monsters, I gave two of those
away to another enthusiast. 533A and 549.
Tubes cost a lot of money, I just could not afford
to restore them but the other chap is dead keen
to get them working. He has contacts in the US
who will send him parcels of junk picked up from
ham field days and trash and treasure markets.
He has put in his list of wanted items to his friends.

All good fun!

Regards,
John Crighton
Sydney

Scopes are cheap, however space is not, at least not here.

I've got two scopes, a 465B and an ancient but beautiful condition 531A.
I'd get rid of the 531A but I need to find a good home for it, it's in
great shape and works perfectly.

96. a couple newbie questions about the Yaesu FRG-7 ?

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-01-03 08:29:52 UTC
From: Arlen Kerbaugh <manx1342@earthlink.net>
Message-ID: <q89kr19aoj9mdg457fl2cnc18rmnvlsdq2@4ax.com>
Source record: 14396

I am new to this hobby and have acquired a beautifully cared for FRG-7. It is externally stock but has the Gilfer MOD-1 kit and a Collins 2.1 kHz mechanical filter installed and documented professionally.

Question 1: Inside the internal battery bay is a slide switch with a couple large resistors (15 & 5.6 ohm) on it. What might this be used for? It looks original to me but I suppose it could be from one of the mods. BTW, this radio has never had a battery in it.

Question 2: Does anyone know where I should tap into with my Tek freq counter to look at a digital output that would correspond to the dial readings on the front? I have downloaded the schematic but am not very radio savvy yet.

A little background: I've just retired from 20+ years as an avionics technician, but, unfortunately, most of my expertise is in radar. Waveguides in place of wires. I've run many aircraft radios across test stations but that didn't help me much (some though) with the theory behind them.

I am in full-bore research mode right now concerning radios and have so much to learn (I've been mostly lost in all the different antennas out there). I'm pretty anal and have been spoiled by mil spec so who knows where this will take me.

Is this the best newsgroup for this type of posting or am I off base here? I know the FRG-7 doesn't have tubes but it is analog. What determines a boatanchor?

Best regards,

Arlen

Fred, Looks like you're covered. If you need more info, perhaps I could help. I have the AF training pack for the unit as well as the original Collins book. As one who's gotten one on the air (sic), I can tell you that there are a few points to ponder. Hopefully you have at least one tuner. If there are no tuner, you can build an external network. The big thing for most of us was/were the L/C tuning elements for the receiver and transmitter. The rx requires two elements (mixer and RF)and the transmitter one (driver). They plug into the boxes in the middle of the unit and screw down to a horizontal bars. Originally, the tuning elements came in a large kit and are set up for chunks of the HF band. I was unable to find any elements, whatsoever, over about a year's worth of looking. I ended up putting three together for just 80 meters. As you may have gleaned, the 18-S is pretty much an ART-13 and simple receiver, sans the VFO and ability to variably tune either the tx or rx.
Racks are unobtainium (unless, again, you got one with yours). The rear connectors can be had from the Wm Perry Co. for about $20-$25 each. I do wish you good fortune with the project. FWIW, I can tell you that, although they did work OK when properly set-up, the AF techs cursed the radio set and were pleased when the ARC-38 and the 618S equipment came into the inventory. The 18S is said to be a stop-gap to provide for compliance with the emerging ICAO requirements. Interestingly, I have copies of the Proceedings which address the HF aeronautical spectrum in the early 50's and the recommendations and requirements made back then.

I will second this line of thought. I have worked on both, and
the 465's, and 475's are way easier to work on than the 453/454.
The 465M is modular, and was designed to be serviced by military
module swapping automatons.

And even easier still is the 2445, and 2465. The parts problem
is a nuisance, but the scopes are wide open, and put together
with the serviceman in mind. Not to mention the fact that there
is no scope, of any vintage, that is nicer to use than a 2465.

-Chuck

OBTW, on my bench, you will find a 585A, 475, 2465, 7633/7D20...,
and a 326.

Good Day, Andrew.
I assume these are actual SCR-274N Army sets
and not AN/ARC-5 or ARA (three different models, all usually
and incorrectly lumped together as "ARC-5").
Unless these are uncommon sets- which would be black wrinkle
and have a tag marked both "SIGNAL CORPS US ARMY" and
"AIRCRAFT RADIO CORP," and have a contract of 1470-NY-41,
then they sound too far gone
for reasonable restoration efforts. Later version
SCR-274N receivers in better shape are common.
Examples with modest modifications that are easily
reversed, such as the "standard" controls in the drawer,
are much less expensive than unmolested sets.
But if you prefer the challenge, you'll need a different
manual. The AN/ARC-5 receivers are not wired the same
as the earlier SCR-274N and the diagrams are not compatible.
What does it say on the nomenclature tags of your sets?
That will help with finding the right diagrams.

73 Dave AB5S

p.s. If they are Aircraft Radio Corp. SCR-274N, they
are worth a big restoration effort.

All Gear working last time tested unless noted. Shipping is extra. Please reply to my email address. Money Oders or Checks Ok. Will ship after Personal
checks clear.

Tempo-1: All Tube Ham Transceiver with Power Supply. Covers 80-10 meters. Looks good and works well. $150

Pearce Simpson: Guardian 23- All tube CB Transceiver/with mobile power cord and mounting bracket. Looks and works Good. $100

Swan 14X DC Power Supply Module: No way to test but was told it was working OK. As is $45.

Siltronix Model 90-6 VFO: Excellent condition with three position crystal switch $60.

Marantz Model 2220B: Stereophonic Receiver, with gyro-touch tuning, blue dial and optional real wood case. This unit is in excellent condition, both in looks and operation. I would rate a 9.7. Also have original manual, in excellent condition. $200

Channel Master: Tube Stereo Receiver (Model 6612) and matching amp (Model 6601) Looks good and plays on FM only. AM not working. $50

Traynor: Group Two B- Audio Amp Head. High/ Low misc. in puts. Master volume, volume, bass, treble and tone shaper controls. All solid state $100

PRO 2003 Scanner: Radio Shack 50 channel(30-512 Mhz.) Digital Scanner with FM broadcast band included. Have two, one is working the other is a complete non working unit. $75 for both.

Bearcat 250 Scanner: Have two. One working at times and one for parts. $35 for both.

RS Pro 30 Scanner: Hand held 16 channel Digital scanner. Looks & Works good, but the battery cover plate is missing $20.

HTX-202: Radio Shack 2 Meter HT. Works good. Slightly chipped where the battery slides in, but does not affect operation. No nicad or antenna, but I will include the AA Battery pack with the unit. $80

Thanks

Oh well, I also wouldn't give up the Tek 454 I have. the best animal in
the analog class.
May be the only concurrent from Tektronis would be a Tek 2465. you can
get one at about 0.6 kilobuck. very nice for the money, with one of the
best triggering circuits I ever saw in 35 years in the field.
Happy new year!

I use DeoxIT, works better and comes in a variety of applicators. In
Sydney you can get it from http://www.caprina.com.au/catp.html or see
Caig website for info and other locations, www.caig.com.
I use the deoxIT D5 and DN5 and their proGold products. Great stuff.

I worked on an old Nicolet The switches were terrible, most all of them.
I spent weeks trying to clean all the switches, mostly the rotary ones.
I had to use all my toughest cleaners. The hardest part was getting into the
partly sealed switches. I used my best cleaners, alcohol, Contaclean,
Alcohol-Cramolin, Buffrog cleaner. Over and over. I didn't use Deoxit, because
I ran out. Cramolin is no longer sold as Cramolin. Its called Contaclean by
the Cramolin Co. a German company. Available from InOne, Farnell.

Hi Arlen,

The resistors might possible be for a battery discharge for NiCads - I once had a switch to fully drain batteries in a radio before recharging them - NiCads were fussy about that. Your resistor values sound about right as a 'drain' for Nicads.

Regarding your Frequency counter, I don't believe you can tap in and get anything but a local oscillator readout. Not sure what the IF in a FRG-7 is, but that's what your meter will read. Someone makes a digital add-on for receivers that adds difference back in so you're reading the actual frequency, not the local oscillator.

I may be wrong on an FRG as they use a funky tuning system that may have the fundamental available as an oscillator but I really can't say for sure.

Dave

I use deoxIt and progold (now DeoxIT GOLD) now since a friend of mine
received it in an Agilent test equipment at work.
I figure if it is spec'ed in there it must be the best. They have an
interesting site, with lots of information and ways of using their
products.
I have a treo 650 which was not charging and communicating - a few
wipes with Progold, oops deoxIT gold and everything is working
perfectly now.

>John

The 7603 is very nice. I use them for the spectrum analyser plug-ins as
the bigger CRT helps. But for normal trouble shooting, I much prefer the
7704A as the basic scope. The same plugins work, but you get a bit more
bandwidth-- up to 200MHz and the fourth slot lets you do some interesting
things with delaying timebases.

For smaller units, I prefer the 475. Nice and solid.

To complement the Tek 3052B digital scopes, I use 7904 with high speed
plugins (like 7A19 and 7B92). The 7904 is the stand for the 3052B.

I use SC502 and SC504 in the TM500 racks when I want to watch something on
the bench without taking up space.

Yes indeed that's is very good purpose if for a spectrum analyser

A long time ago I purchased (in the UK) a spectrum probe useful between
LF and 90 MHz meant for EMC testing in conjunction with a (if you wish
as low as 1 MHz) oscilloscope. I find it a very useful instrument for
homebrewing HF equipment ,although it is of course not a complete
spectrum analyser .

Now in my mid 50's, I am reminded of something my father said. He had always said, that ever since 1957 , he wanted a Cadillac. In the later years of his life, hefinally got his wish - he bought a 1957 Cadillac.

For years I have been collecting and restoring the iconic untouchables of my early days in Engineering. Scopes are like boats, you can never have too many. But they are useful. My particular weakness has been the HP 141T family of Spectrum Analyzers. What was 20K + then, is now cheap. Winter nights are spent re-Cap-ing, calibrating, and restoring these remnants of the last great Analog Spectrum Analyzer.

Like restoring the automobiles of one's youth, these are tangible links to our own past. Any good tool, kept in working condition is valuable. To see these Cadillacs of the past brought back to their former glory is reward enough.

As John said so well, Oh what a feeling!

1. As others have said, when you need to fix your other scope. My 465
just took a dump a couple weeks ago. Used the 475 to troubleshoot it.
One of the HV ceramic caps has excess leakage :(At least it's a
replaceable part.

2. It's also nice to have a spare when the other scope goes down.

3. Sometimes you just need two scopes to do the job, especially when
your project is divided up between two racks of equipment.

4. Sometimes you need multiple scopes because your events are
asynchronous.

5. Some scopes are better at doing certain tasks like those nifty
microchannel plate intensified scopes.

6. Sometimes you have multiple projects going and it's nice not having
to disassemble your test setup.

7. You may have a 7000 mainframe, but need a portable scope like the
465.

8. It's also nice to have a modern digital scope for slow events, math
functions, and documentation. But, keep those analog scopes around as
they convey more information about the signal at a glance than any
digital scope I've used.

You also mentioned something about spectrum analyzers. Extremely handy for certain types of work. Depending on the anlyzer, they are great for characterizing filters, amplifiers, noise in low-level amplifiers, EMI issues, unwanted oscillations, impedance, and a host of other things.

Vanessa Redgrave, Conchita Llach, Carla Ross-Robertson are in line with Mr. Landsberg (Maltese Falcon.)

Conchita Llach: LLach Jewelers, Miami, FL, frequent trips to Guatemala, home (coffee plantations) in San Salvador, El Salvador, father liaison to the Vatican for El Salvador (or for San Salvador, El Salvador.)

Carla Ross-Robertson married to British Intelligence (Jim Robertson.) They perfect mind control techniques using handicapped children in the state of Virginia.

These people supervised the torture of 800,000,000 infants to end God.

The United States, satanic, has been in communication/trade with the Dog Star System, the Plieades, Saturn, Pluto, Mercury, Venus, Mars (and possibly just outside the Milky Way.)

Bonnie, from Mercury, supervises mind control for that world.

John (former Apostle) supervises mind control for Venus. He has worked with actor Bill Murray (DOD, civilian military) on a virtual reality program, "the ritual abuse experience."

Michael, former Archangel, is in contact with the Saturnians.

Does anyone remember the "Jetronics" knockoffs of the Tektronix
'scopes?

When I was going to Army radar school in 1966 / 67, We used a Jetronics
545A (I think that's right).

The Jet was fine for school. Triggered sweep and good to at least 30
Mhz. Before I was drafted, all I had at home was a Simpson
"Handiscope". Rated to 100 Khz, but would see a 262 kc. IF signal.

It's comforting to know that once I was assigned permanent duty at an
Army missile site, all we used were Tektronix and Hickok 'scopes.

Hi

Caig has DeOxit in 5% and 100% formula,
the 5% works most of the time.
You can get it in standard aerosol (hazmat ship fee ups)
or the pump can D5P (no hazmat fees)
www.caig.com

www.mcmelectronics.com has it in stock

Great topic here as I recently decided to try and get my 18S-4 on the air. I am looking for the 314S-4 control head if anyone out there has one. I'm not sure how to change from CW/AM without it. I have the rack and tuner.

I'd like to get the schematic and manual also but don't want the large investment in case this doesn't get off the ground. I have the small handbook but that was a bit of a dissapointment as it doesn't have tech data in there. I believe my unit is complete as it has most of the crystals. Not Ham band but close. I'll have to check what tuning units are in there.

I own some scopes. Though, my favorite is not one of Tek ones,
but HP-1741A storage scope.
Anyway, I realized that when I troubleshoot my scopes or fix
something with them, I always got extra screws left.
It is a bit annoying experience because I know those extra screw
were being used somewhere.
I think that test equipment are made of way too many extra screws.

> Two years shy of forty years of age and the scope still
> works. Bloody marvellous!

It's probably a matter of total operating time instead of
how old it is. I heard a story from an old analog engineer
saying that when storage scopes were new, they were
SO EXPENSIVE that you just couldn't keep them turned on,
but only when you need to take a vital measurement you were
allowed to turn it on.
If that is true, I think some old storage scopes are actually
bargains instead of to-be-avoied.

Switches in that environment
> of damp and dust can't be expected to remain clean and
> reliable. I am just amazed that my 454 scope works as well
> as it does even with its dodgy switch.

I owned one 454, and later used one 454A. The 454 seemed to
comsume much more power than 454A. In winter, having the 454
closer was nice.

Hmmm? I cannot imagine what you like about the 1741A, but different
strokes for different folks.

Be very careful with that grey horizontal timing switch knob. HP cut two
(or was it 3?) slots that each cover 175 (115?) degrees through the body of the knob.
They did that so that you could see the light mounted on the panel through
the knob. Well, when the switch's lubrication gets a little sticky,
and you get a little enthusiastic (and lord knows the plastic is already
at least 18 years old), you will snap those thin little bits of plastic,
and your knob will be gone, and your scope will be unusable. Forget about
gluing it, as there was barely enough strength with the virgin plastic.

We had dozens of that family of HP scope, and they all went into scrap because
the knobs were unavailable.

Tektronix did the same thing with their horizontal knobs, but they
knew enough about materials engineering to make the body of the knob
out of aluminum, and make the grip surface of the knob out of plastic.

I never had a HP scope that I liked, or would use unless there was no Tek
scope available.

I have an extra manual for RF 230 if interested

I also need help in finding a lower sideband filter or filter board

since I have an RF 230 MS (I have a separate manual that is for MS)

MS has no LSB selection position - The CW position is CW/RTTY with

narrow filter

There is NO third filter in either manual schematic. They use jumpers

to select modulation/keying mode.

Will trade a standard RF 230 manual for a filter for LSB.

OR will trade a CW/Data filter for a LSB filter

OR both manual and CW/Data filter for LSB filter

Hi,

I am enjoying this thread a lot.

One nice feature of the 7603 is that you can substitute
a "delaying" or "delayed" sweep plug-in (7B80 or 7B85),
normally used in a 7804 400MHz four-slot instrument,
for the 7B53 normally found in a 7603.

I tried this once in an emergency, and tended to leave
the 7B80 in the 7603 afterwards.
The triggering seems a bit more stable using
a 7B80 or 7B85, and usually I don't need a dual time base.

73,
Ed Knobloch

Still using the 275Mhz hp1726A that was given to me when I started working
for HP in '83.
I keep it covered when not being used, so it still looks like new. Perhaps
some day it will crap out, and I'll try a Tek!!

I haven't seen that reliability is a problem with the 1726A. They go and go... Drift is a bad problem, the zero goes all over the place, and needs constant diddling. It is all but impossible to adjust so that the variable volts/division knob doesn't shift the zero (and have it stay adjusted). The horizontal time knob is a really bad problem, as I discussed in an earlier note. If you haven't taken your scope apart, and oiled that switch's shaft, and replaced the grease on the ball detent, I would strongly suggest that you do so. When the knob breaks, it is end of game. I strongly considered turning out the inside of one of the broken knobs, and making an aluminum version of the center of the knob. The 1726A I wanted to fix was a complete cherry otherwise. But, Tek scopes were so easy to find and so cheap, that I couldn't see any real point. Into the scrap bin it went.

Microdyne had shelves full of HP scopes, but most of the techs would
grab one of the beat up Leader 508A scopes.

Mark, I built a control head. No big thing. Also, AM is the deafult. All you really need do is plug in a mic on the front panel. RF and AF gain must be controlled externally, of course. The crystals you have won't do you much good but you can have a set cut for.. say 3885, or such. That's what I did. I hooked a Heath VFO up to the transmitter and it worked OK. The 18-S4A receiver is much better than the straight unit inasmuch as it has a mech filter installed. The straight unit is as broad as a TCS! Also, I did not use the fixed elements in the TX tank circuit. I brought out the "untuned" RF into an external PI-network (instead of the tuner) for 80 meters. That way, I could tune wherever needed and not worry about the fixed freq. tank components. I have both original Collins 18-S4 and 18-S4A manuals. Unfortunately, I no longer have "unlimited copy capability"...hi!

The Clough-Brengle model 87 transmitter project is on the home stretch.

It is missing one rubber foot, here is a link to the CB-87 project, parts
needed
page. http://radioheaven.homestead.com/CBparts.html
Page down a little and you'll see the photos and details about the foot
needed.

I've got one more knob for the front panel that needs to be cleaned
and polished. And then figure out what I'm going to do about the missing
tuning instruction that go in the holder on the front.
I know from the 2 CCC radio operators that it had printed instructions for
dial settings and the Clough-Brengle name. But I have no idea what
it really looked like.

A month or so ago I got a really nice SW-3 to go with it the recreate the
CCC station shown on the opening CB-87 page.

Thanks to everyone for their help and encouragement.

73, Ron

I've had a 545 (military version), and it was quite good, although it had some calibration issues that I never really got resolved. Most of the time, though, I just used my 475, up until a couple of years ago.

I got rid of the 454 (space reasons), and picked up an HP 54201D digital scope with logic analyzer-type triggering. Although I haven't needed the fancy triggering yet (though it would have been really helpful a couple of times in the past), the scope itself has now become my main scope.

It's good to 300MHz (though I rarely need anything that fast), and I find I'm using the on-screen measurement capabilities and storage abilities quite a lot. Of course, the 475 is still sitting right on top, and in fact I used it to fix a faulty input channel in the 54201D when I first bought it. But really, the 475 rarely gets turned on now.

Oh - the best part was that the 54201D only cost me $50 at a Ham swap meet...

Oh, and servicing the HP 54201D scope was pretty easy. It came apart in obvious ways, and the boards were big, double-sided (not multi-layer), and gold plated. There were a couple of scary-looking custom IC's, but the problem in my case was just a burned-up 100 ohm resistor.

I eventually bought (rented and copied, actually) the operator and service manuals for it, from W J Ford, who were quite easy to deal with and had a *really* large stock of old manuals.

Hey, small world. Rich already contacted me, and I did have one other bit that he's looking for. But my junker is missing the things he mentions in this thread, so I suggested he post here. Surely I can't be the only one on Planet Earth with a junker SX-42 :-)

> Knob style binding posts
> http://www.abbatron.com/products/part/get/ppj_ibn_knob

At a glance, the type A knurled binding post from Abbatron looks closest to the SX-42 part. The others would work if that one's too fat. It would have to be insulated from the chassis, of course, but if I'm not mistaken, the original antenna connectors are mounted on a little phenolic board. I should order a couple myself. Two of the connectors on my set are half-stripped and wobbly.

Regards,

Phil Nelson

Yes, H.H. Smith had many owners over past 15 years - but I think it has
settled down and the move to Meadville (western PA) was likely a good move).
At one time, their web site had the entire original binding posts (past 75
years) .. they removed some of the models from the web site lisitng --
which I guess was due to lack of interest of sales.
Restorers should be jumping on some of these items -- since H.H. Swmtich was
likely the origonal suppleir when they were in New Jersey.

They also have the old style "pin plug" that were used extensively in the
1940s for headphone jacks, etc.

Scrap? Surely a machinist could make a suitable replacement knob for
less than the value of a good scope.

You obviously haven't hired a machinist lately. In pristine shape, the
scopes were worth $75 tops, the machine shops charge $100/hour, 1 hour
minimum.

I was going to do the job myself, but balked because even when I was done,
all I would have was a bunch of scopes that no one wanted to buy. We had
them (with the broken/missing knobs in the $15 pile at several hamfests,
and they went nowhere.

May be relevant. When a plastic eyepiece on my father's WW I binoculars
shattered I found a company that made an exact copy from the other
eyepiece which I sent them. This was some twenty five years ago.

I don't know what the plastic was, possibly some form of Bakelite or
Ebonite.

Every now and then, one lucks out on a HP scope. For the most part, the HP
scopes I've used have been pretty marginal. There was one that was an
absolute nightmare, but that was a special case, because it was military,
and <oh, shit, apologies in advance> it was in a special case. <rimshot>
The knobs all had little waterproof rubber skirts, which had backlash that
makes ordinary backlash look like nothing at all. You had to go _WAY_ past
the setting you wanted, and hope that when the knob sprang back it would
land on the setting. I remarked to a coworker: "It probably wouldn't even
be a good boat anchor, because it would float."

I _did_ once use an HP that was tolerable.

But If I'm the one who signs the check,
my first choice, of course, would be a Tek. :-)

Cheers!
Rich

Do you still have washers under all the connector screws? On my SX-62, the connector screws threads were undercut at the base. I was missing a couple of washers, and the phrase "half-stripped and wobbly" would have described the connections perfectly, until I replaced the washers.

No, they became short of CRT's because of their success in
network analyzer business, perhaps.

It seems that more people are having trouble with HP scopes
than I thought.
One has to treat scopes gently, just like treating women's body.
Instead of "pushing" buttons, one has to "touch" them.

That's just it, they all had the main knob broken. Some had the pieces intact,
but broken, others had nothing.

All worked, and all had the usual HP problems with drifty vertical amplifiers,
and easy to fool triggers. It wasn't worth fixing them. We also had dozens,
upon dozens of tek 465, 475, 485...

The tek scopes flew out, regardless of condition, the HP's just sat.

-Chuck

Long ago I was given a summer job to repair a palletload of HP 1xx scopes. One had a bad power transformer, unobtainable. The rest just needed new power supply filter capacitors. They seemed like nice scope, within their limits. Not particularly fast or bright or DC stable, but okay for our biomedical lab. I think that one had an actual knob on the DC balance control, it was so shaky.

I know this sounds like faint praise, but there's just something about a scope without a fan, with nice big knobs that go click instead of clunk, and that need no bandwidth limit button to keep the FM-ROCk-101 from fuzzing up the trace.

The HP 175 was an impressive scope-- 50+ 6DJ8's, 50MHz bandwidth, and a super bright CRT. It just ran and ran up until 1995 when the TRANSISTORS in the power supply went bad.

Still use a Tek 475 as my main bench scope.

Have tried several 54xxx digital scopes, don't care for the yucky green or amber screens, or the infuriating menu structure, or the way they don't detect clipping.

I have several Tek 485's on the to-repair shelf. IIRC they have about six power supply voltages and if any one of them gets out of spec the whole thing shuts down. Then it's kinda hard to figure out which one went blooey first. Grrr....

I have a manual coming, if you have any particular areas you need info on
let me know.

If the copyright has expired, I will scan it an publish it on LuLu press.

I have two and I am awaiting the manual to see what goes in the rear of the
chasis that seems to be missing from both of mine.

There is a cradle that goes across the back and nothing occupies the space
on either of mine.

172. Capehart R-390A

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-01-07 01:11:39 UTC
From: Fred W4JLE <w4jle@w4jle.com>
Message-ID: <c28da$43beeb5f$471d2687$12572@ALLTEL.NET>
Source record: 14321

I would like to trade a Capehart R-390A for a linear.

Prefer something using 3-500Z tubes. I have tubes if yours doesnt. Looks are not all that important, but working condition is a must.

The R-390A is in nice condition with no mods. The Megacycle and Kilocycle knobs work freely and checking against WWV seems to be on frequency.
Like any receiver of this age it could use an alignment and possibly some tubes are weak.

There are no covers or case with the receiver. If you are interested, we can swap pictures. For a really nice amp, I will throw in an antenna coupler (CU 168/FRR) that can feed 5 receivers.

Like the receiver, the coupler was designed by Collins to go with the 390's but this one manufactured by another company. Looks like new.

I don't want to overstate it, but it is clean for it's age and is not one of the junkers floating around on ebay.

Well no I haven't hired one because friends of mine own a machine shop
so I can get favors like that for free but still, $75 tops? We're
talking a pretty decent scope aren't we? When I bought my Tek 465 a few
years ago I couldn't find anything 100MHz dual trace in working order
for under $275 or so.

I keep seeing the term "VTVM", but what is so special about them? What
is better about them than my cheap little Radio Shack multimeter?

They are from the days before transistors. "VTVM" stands for Vacuum Tube Volt Meter, as opposed to a plain analog meter with no active components.

In today's world, about the only advantage they would have is immunity to massive voltage overloads that would smoke a solid state device. I'll bet if you accidentally touched the anode lead of a CRT with your solid state meter it would be history. A VTVM would most likely survive.

Mostly though, is the nostalgia. I used one for twenty years doing TV repair back in the tube days. It did the job, but I have to admit my everyday meter now is a Fluke 87. Sigh.

Bill T.

** If that Radio Shack meter is a reasonable digital one - then not a great deal.

If a cheap analogue type - then a good VTVM eats it alive.

Egs .

10 megohms input impedance on all AC and DC volts ranges.

Wide AC frequency response.

Pretty much accidental abuse proof (aside from a big drop).

The big meter looks very cool compared to an LCD display.

One drawback is that readings are ground referenced as with a scope.

..... Phil

For a lot of vintage tube related repairs, you don't need accuracy or
precision, but
the analog meter is a lot easier to follow when doing alignment, etc.

Unless you have a Heath VTVM that used a 6AL5 for the AC
rectifier in the metering circuit. Getting across the secondary
of a modest receiver's power transformer usually arced the
6AL5, taking the meter movement along with it. Heath replaced
those associated parts at least two times in my kit before I
swore off using it for AC measurements.

It is with some regret, I guess, that I list the following gear. The new QTH will have a lot less space (read: no basement, etc.) so a good (not all!) portion of my hard-fought collection must be divested. Its been a good trip getting all this stuff, fixing some of it up, re-capping, the gamut. Everything listed is fully operational, unless specifically noted otherwise, and is generally "on the air" at this time. Nothing has been in my Grandfather's attic, Aunt Minnie's garage, or worked when I put it away just before the Spanish-American War. Inspection, acceptance, and pick-up is at my QTH, I won't chance shipping this equipment. I can fwd a pix if you need one. Ratings of the eqpt are, I think, conservative. But, that's why I want anyone to see and inspect each piece. If you need more specific info, please QSL.

1. BC-312N, AC, SCR-399 hooks, cont. connector VG+ $210
2. SP-600/JX-21 w/ cabinet VG+ $400
3. URR-35/URR-27 UHF/VHF rcvrs, audio amp panel, rack VG+ $195
4. RBM MF Rcvr, HB ext. a.c. supply VG+ $145
5. RBM HF Rcvr, HB ext. a.c. supply VG+ $145
6. AN/GRC-19B, PP-4763A, access, 120w on 3885. EXC $700
7. Bendix BC-638A/RA-42A, (cabinet) as-new $140
8. RCA 8506A HF Rcvr (Liberty/Victory ship) Exc. $225
9. Chicom 102E radio set, complete, ER tune-up New $295
10. Chicom 884 VHF radio sets w/batt+chgr+access New $210 (pr)

Actually, that isn't quite true. The impedance of a "cheap little Radio
Shack multimeter" is likely to be very low - in the order of <100K
A VTVM is likely to have an impedance >10Megs and if you're measuring
100V across 1Meg, inserting a 100K impedance into the circuit *is* going
to give you problems!

http://www.elexp.com/t_load.htm

I agree that impedance and absolute accuracy may be better in a good
DVM, but sometimes a VTVM is very useful. Do see this article for an
explanation:

http://www.tone-lizard.com/VTVM.htm

Cheers,
WS

Most fluke meters survive pretty well. I've burned out a 1k fuse
resistor twice now from accidental overloads. The latest was from
touching the plate lead and getting a nice purple RF arc. Tought that
killed it for sure.

Adam

OK, to clarify, I was comparing apples to apples (i.e. analog). The
specs for a currently available model is here:
http://www.radioshack.com/product/index.jsp?parentPage=search&cp=&productId=2103170&kw=multimeter&tab=techSpecs

While cheap DVMs have higher input impedance, they aren't quite up to
VTVM standards. The cheap DVM that they list for $19.99 only has an
impedance of 1Meg, which is still low enough to affect readings in
certain cases.
http://rsk.imageg.net/graphics/uc/rsk/Support/ProductManuals/2200810_PM_EN.pdf

Only the $25.99 and the $49.99 models are 10Meg.

The point here is that it's not purely "warm fuzzies", but that each tool, including the VTVM has it's place, and it's limitations, as shown in the links you snipped.

Regards,
WS

Not to mention incredible amounts of fun! :-) :-) :-) (look at a pulse's spectrum sometime, and twirl the PRF and PW knobs and watch the pretty pictures dance...)

Not only that, but its very name is ripe for _so_ many play-on-words jokes! "rectum analyzer?" "spectrum ANAL-izer?" etc.... ;-)

Cheers!
Rich

Not only that, the frequency range of said cheap DMMs is usually very
limited (up to 400 Hz I believe).

My various Fluke meters aren't much better, BTW.

My Fluke, with built-in scope function, goes to many tens of kHz very
comfortably.

That's *not* a DVM of course ! Nor especially cheap.You have to pay quite a lot for moving
coil meters. I did
wonder if that was what you meant.

They are still hardly expensive !

The error simply reading the needle on a VTVM will exceed the measurement error on most DVMs.

Most of the VTVMs i have owned had either a separate probe for DC
measurements, or a switch to select AC/ohms or DC. They had a 1 megohm
resistor at the probe to keep from loading down a tuned circuit, or
stopping an RF oscillator, which would change the voltage. They are
still handy when looking for oscillator problems on PC boards.

Well, it has a much higher input impedance than a cheap Radio Shack
analogue meter, and it also has a probe for reading RF.

The RF probe combined with the high input Z makes it very handy for
peaking coils and similar operations which are next to impossible to
do with a digital meter. You can't see trends easily on the digital
meter.

A modern FET-input analogue meter with an RF probe will do just as well
as an old VTVM, and it'll be more stable too. But you won't find one
at the hamfest for five bucks like you will a good VTVM.

I have several old Flying Horse Radio Amateur Callbooks for sale. They are all in very good condition for their age. Covers and binding are all intact and in nice condition. There are some creases around the edges of some of them and the pages have yellowed with time. They are all complete.
1. Winter, 1948-49 Issue, Volume 26, Number 4. Price $35;
2. Fall, 1949 Issue, Volume 27, Number 3. Price is $35;
3. Summer, 1950, Volume 28, Number 2. Price is $30;
4. Spring, 1952, Volume30, Number 1. Price is $30;
5. Fall, 1955, Volume 33, Number 3. Price is $30;
6. Fall, 1961, Volume 39, Number 3. Price is 25.
Shipping is an extra $3.00 for Media Rate US Post Office.
Thanks, Charlie Hugg, K5MBX

A scopemeter, well, duh! :-)

I have a Fluke 12, a 73 and an old 8000-something, and they won't do
anything accurate above 1 kHz.

Mine is an 867B. Just read the spec, and it is good for 300kHz full
RMS. It is also just about bomb-proof as far as I can tell. One nice
feature is that it also gives a pretty good imitation of an analogue
display.

I suppose. I haven't used my old VTVM for alignment in so many years I have forgotten! I think much of that argument has been dispelled in recent years with DMMs that update and refresh the display faster than the wink of an eye. I remember the early DMMs that weren't worth a crap for alignment even with the little 'bar'... that had poor resolution.

Biggest DMM plus for me is that I can set the meter right alongside the chassis and glance over and see it rather than looking up on the shelf. And I can actually see the big 1 inch numbers without squinting my tired old eyes on an old faded 'red' scale :)

Fluke 97 is good to 50MHz.. though I wouldn't say it's resolution gives a
very true waveform image.

Pete -

Yes, I have used eSnipe for items that I really want.

Workbench is full of Weller TCP-1 irons (circa 1967 to 1973) this weekend
[Thanks to Richard, W1KSZ]
2 of the 3 are working tonight, third will need more time for replacing
frayed cord.
Nice 1968 model goes back to Richard - ASAP for his matching black bakelite
PU-1 power unit.

I have not seen this many 1960's era TCP-1 irons, since my first repair of 5
TCP stations in 1975 ..that started me on this Weller "fix-it" path.

Other workbench has the Drake R-4C, finally got the Plextron R-720 antenna
and power cord earlier this week -- playing local VHF NWS channel !

You can use a little Radio Shack Weathercube for that. Put that R-4C
into doing something respectable ... and gain back a workbench. :)

Nobody has mentioned the MAIN reason VTVMs were preferred for radios years ago...

The standard VTVM circuit has an impedance of 10M in the meter and 1M right at the tip of the probe (on the DC ranges, the AC ranges are direct connections). That means that the capacitance of the cable and the input capacitance of the meter is virtually isolated from the circuit under test.

Using a standard VOM, of any impedance, to measure the DC grid voltage of a tube local oscillator is generally fruitless because the added capacitance of the cable and meter, sometimes 100 pF or more, loads the oscillator and either stops it or badly detunes it. The VTVM however has only a very few pF at the tip (on the DC ranges) and provides only minimal circuit disturbance. That is why VTVMs either have separate AC and DC probes or a probe with a switch. I get a kick out of the experts who modify their Heath VTVMs to work without a switchable probe. This completely defeats the only real remaining benefit of a VTVM!

Now, if someone designs a DVM with a 1 M resistor in its probe to accomplish the same result, we can officially announce the death of the VTVM. Of course, using an oscilloscope with a 10X probe accomplishes exactly the same thing.

Ha ha .. well the Plectron is running the local area NWS audio. Came from SC college radio station - cleaned up fairly well.

Drake R-4C is being cleaned (Simple Green to remove slight nicotine odor/haze) - this was a one owner estate item. Removed a couple jumpers under the Noise Blanker socket (lost Drake factory jumper or seller removed blanker and did poor job) -- and installed the Leeds Electronics 7-pin plug .. looks better than Drake's original ! Just installed the second IF AM and 500 Hz CW filter. Bob Sherwood's audio and power board will be next week - if I have time.

Yeah, well you offset most VTVMs for a zero center reading for aligning
FM discriminators!! So there! Do that with your fancy DVM! HAR!

No need to offset. I can recognize the digit 'zero' and a little minus
sign pops up when I cross it. Harhar!!

Thanks for the responses so far....

A few more questions...

How many of you use racks for storing your test equipment?

When you have a choice, do you choose equipment that is rack style or
table top in form factor?

Of the racks used, are they full racks or partial racks with storage?

For storage, what do you use...cabinets, shelves, chests?

What do you for lighting?

TMT

I hope this is not a double post, but I've waited 8 hours and have seen nothing.

Fred mentioned on his first post that the dynamotors had been removed from his two 18S units.
When I saw illustrations in this instruction manual, the first thing I saw in a top view of the unit were the 811's and mod transformer. They certainly appear to be lifted from an ART-13 as well.

It's been a long time ago, but my father told me about the 18S receiver and the fact that only 28 volts were used on the plates and screens. I was just a kid of 9 or 10 years old. Even back then I knew that most radios needed a hundred volts or so. Even the "All American Five" series string AC/DC sets had better than 100 volts B+.

Why not just say all meters, even the most crappy, has their strengts!!!

For the warious reasons mentioned i simply use all my meters
occationly.... - Also more at the same time. :-D

And, amongst others, that's:

ANTON TS505D/U VTMM, with 500Mc's calibrated diode-probe....
AVO Mk. 8
BRUNO ME-70C/PSM-6B multimeter with dc-z = 1Kohm/V or 20Kohm/V :-)
Br�el & Kjaer 2401 mV VTM
Grundig MV20 mV VTM
HP 4½ digit. 34702A Bench DVOM
Metex 3800 DMM

- They ALL work FLAWLESSLY, and i wouldn't part with any of them!!!

Best regards
Tonni, Denmark

Keep the glow up!

In Fred's first post, he mentioned that the dynamotors had been removed.

When I first looked at a topside view of the 18S in the instruction book, the 811's and mod transformer sure look like they came from an ART-13 as well.

I agree in principle. I have a list of meters much longer than yours, but I really use only three, a B&K 5492A, an HP???? AC Voltmeter, and a Fluke 87 handheld. I have a couple nice scopes with readouts and math so I use those as meters for some applications, like measuring RF voltages, or calculating phase angle or power. I really like the B&K 5492A, it replaced a whole shelf full of single purpose meters, but it has a dual display so you can measure two parameters at once.

The problem I have with test equipment is space on the bench. I have all kinds of stuff in storage, but it really boils down to using the instrument that puts the greatest versatility in the smallest space. Once in a while I need to do lots of simultaneous measurements and drag out lots of stuff, but that is rare.

I have a probe which uses 1M to 10k R divider which reduces the voltage
100 times and causes little problem with most AM radio circuits,
and the stray C is low.

So if you have 10V DC to measure, it comes to the meter/CRO at 0.1V.
Or if V = 1000V, 10V is at the meter or CRO.
Where 1000V is involved, the I flow is only 1mA, which usually
won't upset too many things you may test in tubed gear.

I have the R divider with 3 x 330k in series then the 10k , and mounted on a
300mm
peice of wooden dowel with generous multi layer heatshrink to prevent
stray unwanted contact when the small hook probe end is being
hooked around a circuit.

Its nice to see the IF envelope of an IF stage without losses, or the
detector envelope etc.
Many voltages in RF or IF stage outputs is quite high, maybe 100Vrms of signal
at the 455 kHz IF, so its easily read after reducing 100 times in level.

The output from the 10k is OK for most CRO at relatively low RF.

But for better measuring, mounting a tube cathode follower in a can with
umbilical cable and screened lead from the cathode and bootstrapped grid bias
gices a nice rugged
high impedance low capacitance probe that reduces the input voltage only a dB or
so.
A 6J6 may be quite good, EC97, etc.
Maybe a 6DJ8, 12AT7 also.
But input voltage is limited to the
max Vo of the CF, maybe only 40Vrms.

The grid input to the follower must have a DC blocker cap
to stop the probe affecting DC bias voltages in grid circuits.

If such a probe with a 200V supply and idle V at the CF cathode is say 100V,
then connecting to a bias voltage of -40V will make the CF cut right off.

But such a proble won't mind occasional overloads that would
blow the crap out of a j-fet.

Patrick Turner.

My millivolt ac meter I made has Vin limiting, fet input, all SS amplifying
and a 1metre shielded cable doesn't do much to most signals.
R in is 500k on the lowest range of 0-10 mV, but much
higher R in when measuring up to 1,000V.

Bandwidth is 2Hz to 2MHz, and some C compensation across the
Rin switched dividers is required to flatten response.

For measuring smallish signal voltages to 30MHz
I have a wide band amp with two RF transistors that gives 26dB of gain,
50 ohms termination output impedance, and which is in the millvolt meter.

I have a couple of partially stuffed/burned VTVM laying around that I was given,

but I doubt i will bother to repair them.

Patrick Turner.

Pete -

I shared that dream, ever since I saw my mentor's Drake "B" line in early
1970s.
About gave up the dream last year, but when you least expect it ... you find
a one owner receiver in good cosmetic condition .. just before Christmas ..
who say's there is not a Santa Claus !

I am not demodulating the NWS signal. I have thought about that for a
project someday -- but not on current list. Nice solid state VHF FM
receiver.
Just listening to the robotic/human audio !!

Greg

227. Minature tube (7-pin & 9-pin) plugs

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-01-08 20:13:12 UTC
From: gb <onw9mapsgb@no.arrl.spam.net>
Message-ID: <3MWdnbifoPHE71zeRVn-jw@comcast.com>
Source record: 14274
Cross-posted to: rec.antiques.radio+phono,rec.radio.amateur.boatanchors

This usage of a miniature tube socket and plug as a connector / plug
combination was prevalent in 1970s amateur radio designs (e.g. Drake,
Kenwood TS-520/820, Icom 22S).

This connector / plug combination was smaller than the Amphenol / WPI series
86)
Octal socket / plug that was used in the 1950s and 1960s.
http://www.triodeelectronics.com/amphenol.html

Modern DIN and mini-DIN connectors replaced the usage of miniature tubes
sockets and plugs in the 1980s and 1990s.

Drake used 9-pin and 7-pin miniature tube sockets in the chassis for its
Noise Blanker option. The noise blanker (when installed in the radio) had a
7-pin or 9-pin plug (depending upon specific noise blanker and radio)
attached at the end of a cable that plugged into this chassis mounted
socket.

Drake shipped a factory supplied jumper plug, when the noise blanker was not
installed. Alas, after 30 years these jumper plugs routinely disappear.
It is not uncommon to find this problem in Drake radios, due to eBay sellers
stripping the noise blanker from a Drake radio (like the optional crystal
filters) to gain a few more dollars from the radio carcass --- just like
auto salvage yards.

The Drake R-4C (s/n 27893) currently on my workbench did not have its
factory jumper plug. Someone had crudely soldered 2 wire jumpers to the
underside of the 7-pin noise blanker socket. Most likely the seller
extracted the noise blanker for a quick $100. Besides being a terrible
soldering job (definitely not very talented), it consumes time for the owner
to add the noise blanker option in the future.
I prefer to restore my radios toward original (while the parts are still
available) and
appreciate the ability to "plug in" the optional Drake noise blanker for
routine
testing.

Fortunately, these parts are available for the Drake or radio restorer.
==========
Leeds Electronics in Brooklyn, NY has both the 7-pin and 9-pin miniature
plugs !!
(Leeds is an old NY Radio Row company that moved with WTC was built in
1960s). Leeds Electronics has a number of other hard to find items for
radio
restoration.

Leeds Radio & Electronics
68 North 7th Street
Brooklyn NY 11211
Telephone: 718 963-1764

7 pin miniature plug - fits sockets for 1L6, 6AU6 etc [USED]
good for making tube adapters and test jigs (rife) $1.50
(OUT OF STOCK)
http://www.leedselect.com/images-sockets/plug-7pin.JPG

7 pin miniature plug -fits sockets for 1L6, 6AU6 etc
good for making tube adapters and test jigs with
screw on back shell - NOS $4.00
[This is the part that used in my Drake R-4C,
identical to Kenwood's 9-pin VFO plugs - see below]

7 pin miniature cable mount socket - fits plug above
good for making tube adapters and test jigs with
screw on back shell - NOS $4.00
[This is a CABLE MOUNT socket - mates to above]

9 pin shielded plug - made by Vector (rfe) $4.00

9 pin miniature plug fits sockets for ECC-83, 12AX7
good for making tube adapters and test jigs (rfe) $3.75
==========
A 9-pin jumper plug is required for the external VFO socket on the
Kenwood TS-520/820 back panel for proper operation of the radio.
The Icom 22S uses a 9-pin socket for an accessory socket.

Kenwood continues to sell the 9-pin plug and screw on cap:
Kenwood part number: E05-0901-05 for $ 5.00
This is available through its parts distributors:

East Coast Parts
http://www.kenwoodparts.com/

Pacific Coast Parts
http://www.pacparts.com/

UK also has 2 parts suppliers:

Correct, in fact I have a Heath IM-28 just for that reason (and its the only
analog meter). Yes, I have the Fluke 87 also and use it for most routine
bench measurements .. but the Heath is used for alignments and when I want
an analog movement to see what is really going on ..... about same reasons
some good troubleshooters still keep analog scopes.

230. FA: Hughes AN/PRC-74B HF Packset, excellent appearing, 100% operational, w/accessories

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-01-08 20:53:40 UTC
From: Mark@The.KB
Message-ID: <fnu2s15cd8f4fb03b0e51gi6r8sn7reh9l@4ax.com>
Source record: 14277

I've just put up a Hughes AN/PRC-74B HF packset in excellent operating condition, with critical accessories (some of which have become quite difficult to find).

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=6595561162

I built up this unit from separate
modules and a spares kit panel/chassis. Repairs and alignment were done whenever necessary to bring the radio to original Hughes specs.

This included replacing any synthesizer crystals that had aged out in frequency too far to allow alignment. All crystals are now within frequency spec, and all frequencies will calibrate.

This radio now meets or exceeds the original Hughes specs.
Included in the sale are the original canvas accessory bag, whip antenna, flexible whip base, whip bracket (now nearly impossible to find), metal battery box, dipole fixture, and H-250 handset. Just add a battery and you're ready to go.

That's absolutely correct. They (Collins) used as much of the existing ART-13 parts, it appears, as possible. Seems like the thing to do, given the design task at hand. Its just too bad they designed it with plug-in components. At the time, though, 20 channels was quite sufficient the HF aeronautical service. And, if you ever see one of the ART-13's with the Comco crystal oscillator in it, that was the original attempt to get a satisfactory rig for both the military and the airlines. I've tried to find out how many years the ART-13 was use by the airlines, but no joy. When I worked for Page Airways FBO (DCA) in the mid-60's, they had the books for the Comco ART-13A and the souped-up ARC-1 VHF set. It appears that the ART-13 was considered unusable somewhere about 1955, although my ATC came from Moffed Field and had a NASA channelization chart with a 60's date on it. I still notice ads in 50's and early 60's QSTs for the surplus dealers trying to buy-up ART-13s and BC-348s. Maybe for the 3rd world? Maybe NASA pushed the date on mine?? Probably why it still works so well...hi!!!

Thanks for the responses....

Of those who use racks to hold their equipment, how do you have the
equipment arranged and how are the racks distributed?

For storage, what do you use? What works and what does not?

How about lighting?

Thanks

TMT

Jeep,
I too recall the adds in QST and CQ from commercial companies looking for 348's and ART-13's. I always figured that stuff was destined for South America. Also, I knew an old timer that worked for an exploration division of Magnolia Petroleum, and he worked with BC-312's and 348's and even a Hallicrafters HT-9 transmitter. All of this stuff was really considered obsolete in the early Sixties, but I guess it proved reliable and was used for some form of field communications.
I mentioned earlier that my father was a field engineer for Collins from '52 to '55 and worked with the 18S and 180L tuner. I was a kid back then 8 or 10 years old, and I still remember being intrigued with the 18S receiver when he told me it had no B+ supply, but used 28 volts for plate voltage.
John

Thanks for all the responses....

A few more questions....

How many of you use racks to hold your test equipment?

If you do use racks, how do you have your equipment arranged?

Are the racks full length racks or do you have part rack and part
cabinet?

How do you handle parts storage?

How about lighting?

I have an older Yeasu FRDX-400 pair, Rx and Tx. They are in pretty good shape, but the chassis' are not all I would like. They appear to be lightly plated steel, and finger prints from years gone by are sort of etched into the plateing. Is there a good way to get that damage off without making things worse? I'm thinkinf of the metal polish "Never Dull," that comes in wads packed in cans.

I'm sure you fellows have seen this question many times, so what is considered the best way? The cahssis is not actually dirty.

Thanks, Martin

Guys,

I've been to Jeep's place and purchased an early S-Line from him.
(two 75S-1's, a 32S-1, 30L-1, 312B-4, etc)

I am overjoyed with the S-Line. I never thought I would ever have a
station this nice. I've seen how he treats his radios and would not
hesitate to buy anything from him.

If you have ever wanted any of these, buy it now before someone else
does.

Apparently Google had some problems on Sunday. I've noticed others
complaining on other groups.

Usenet is simply an open bulletin board type of thing. Nobody owns it,
nobody runs it. Each outfit maintains its own servers, etc. They
aren't necessarily interconnected in any way. Google is just a portal.

I can't seem to post on Google, so I'll try it here on Talkabout.

Fred mentioned in his first post that the dynamotors had been removed from both of his units.

When I looked at the pictures in this 18S instruction manual, the first thing I noticed were the 811's and mod transformer. They look like they were lifted from an ART-13 as well.

If you'd like to save $180 or more, this makes a nice radio room clock.

http://antiqueradio.org/art/temp/MastercraftersClock.jpg

I have two of them. The second, missing the dial cover but working perfectly, cost $1 from a junk box under the table at a swap meet. I think there are many more out there.

Much as I like Chelsea, a quartz movement doesn't add up. A Benjamin Micheals (sp?) 24 Hr clock looks just as nice. If you want accuracy, get a MFJ atomic clock. BTW, Chelsea wanted $400 to change the face of my Maritime Commission clock over to the "radio room" version. I understand someone else may be able to do the job just as nice. Any leads?

255. How come I can post on Talkabout and not on Google?

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-01-10 01:13:51 UTC
From: Litzendraht <k5cey@-nospam-juno.com>

Source record: 14292

I still do not understand this linkage between Google Groups and
Talkabout.

If I post on Google, it doesn't work. But if I post on Talkabout, it shows
up on Talkabout and Google.

I prefer reading Google because of the format.

But I have to post on Talkabout to be heard.

This stuff's over my head.

John

256. FS: Transmiiting/Boatanchor Tubes

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-01-10 02:07:55 UTC
From: Jim McShane <jimmcshane@prodigy.net>

Source record: 14206
Cross-posted to: rec.radio.swap,rec.radio.amateur.boatanchors

I posted these a few weeks ago, and some found
a home, but I still have a lot of tubes that I can't really
use - so I cut the prices further. Here's an updated
price list:

Qty. Type Web Price My Price ea.

1 2K25 $25.00 $11.00

1 3E29 (829A) $14.00 $7.00

1 5D21 $42.00 $19.00

1 705A $10.00 $5.00

3 815 $15.00 $7.00

1 826 $35.00 $16.00

2 829B $14.00 $7.00

2 832A $7.00 $3.50

1 8122 (used?) $225.00 $75.00

1 7034/4X150A $90.00 $40.00
(new in box Eimac)

(3) 4-125A/4D21 $95.00 ea. $47.00 ea.
(2 Eimac, 1 GE)

I can't test most of these, but I guarantee no DOA
tubes or I'll refund the purchase price.

Drop me a note if you can use any of these, thanks!

$200 for a quartz clock in a plastic case.

You can get one for $180 on eBay. I still think the old Mastercrafters clock with world map is cooler. Best of all, it's not a quartz clock in a plastic case :-)

Phil

Mostly shelves especially sized for the test gear.
>If you do use racks, how do you have your equipment arranged?
>
Most frequently used test jigs front and center on the shelf directly
over my bench, less often used jigs to either side and portable
meters(vom's esr's etc...) on the test bench to the rear or stored in
drawers directly under the bench.(hand tools such as screwdrivers and
such are mounted on the wall in 2x4's with drilled holes or
clamps/hooks to hold them.)
>Are the racks full length racks or do you have part rack and part
>cabinet?
>
>How do you handle parts storage?
Metal storage cabinets for some parts.(most frequently used.) others
stored in plastic storage tubs with lids(pushed under cabinets or
shelves) Also some metal shop shelves for
aerosols/cleaners/abrasives/paints etc...

I've also been fortunate in obtaining metal storage cabinets with
drawers from local hardware stores that toss them when remodeling,
indispensable when trying to collate the massive amount of
nuts/bolts/screw and small parts I accumulate from scrap salvage or
toss offs of others.(I probably hold the title for worlds biggest
parts scrounge.)

>
>How about lighting?
Flourescent, mainly because I can get the fixtures for nothing. People
are always tossing them out in all shapes and sizes.(Some can be
extremely wasteful when remodeling or rebuilding.)
Also flouro is of course much more efficient resulting in much lower
electricity bills for your shop.
I also have a number of the flex-arm work lights, both flourescent as
well as incandescent. I have one mounted on the corner of my work
bench for all the close up work I have to do.(The incandescent
flex-arm lamps can easily be converted to flouro for general work by
using a screw in spiral tube flourescent bulb , or converted back to
high watt incandescent for work requiring more intense light.)

People toss out those flourescent aquarium light fixtures all the
time.
Most are 18 inch and make excellent under shelf light fixtures for
light directly on the bench.
The tubes are easily swapped out for normal balanced tubes and the
black plastic housing usually have open spaces on either end to allow
drilling holes for mounting to the under shelf.(I use #8 x 1 inch
sheet metal screws with fender washers to mount them. takes just a
couple of minutes and you've got a nifty under shelf light for next to
nothing.)

From: Steve <zarco@sonic.net>
Message-ID: <43c3e68d$0$95989$742ec2ed@news.sonic.net>
Source record: 14212

I'm having a hard time resolving a problem on an SP-600,
JX-26 I'm restoring. Hopefully there's someone out there
that can help.

On the 3.45-7.4 MC band (only), received signals are somewhat
distorted. Normally, when tuning in a CW signal with the BFO on,
you'd expect an undistorted tone as you tune. On my radio, it'll
sound more like a growl. Signal strength doesn't seem to matter.

I just finished a complete re-capping of this radio. Anyone need
about 60 leaky black beauty caps??? The problem existed before
I re-capped the radio. I was hoping new caps would solve the problem.
It didn't.

As I mentioned earlier, all other bands are fine. Sensitivity and
selectivity is good.

I have removed the ceramic tuning sections, and didn't find any
cold solder joints or flakey contacts. All tubes have been tested
and are OK. Power supply voltages are normal.

Steve

I just received a NC-300 with small chassis in the accessory plug I can not figure out.

It has a stamp on it of "74400 Millen".

It has four tubes looks like the VHF converters except: (1) The tube lineup is 3 inline and one double. (2)The are no external IF plugs.

Also, in testing, I am receiving good audio but no stations. All tubes light.

Any help appreciated.

Since this problem is showing up on one band only,I would connect a
scope to the switchable oscillator and check the stability of the osc
signal on this band. It could be trashy or FM ing..Thats about the
only thing that would show up on one band only..Other places to look
would be the band switch,defective osc circuit ,such as damaged
parts,bad trimmer caps,coil form etc..GL W4PQW

The crystal calibrator has it's own socket. It's there and has one tube.

This is a mystery because all the accessory socket on the NC-300 does is supply power.

Good news it is working now. It looks like something inside came back to life

Interesting coincidence... I got a 545, complete with cart and
probes, for free, several years ago. A bit cumbersome in my limited
lab space in the basement, but the price couldn't be beat.

It finally died on me. I sold it for parts and bought a nice 465B
(off the e-place, where else) that now sits on the same cart. What I
got for the 545 bought me a copule of probes -- all's well that ends
well...

The Millen 74400 is described as:

'OCTAL, BASE AND SHIELD

Low loss phenolic base with octal socket plug and aluminum shield can.'

What you have is a 4 tube home brew device that plugs into the back of the NC-300 using a Millen 74400 case.

If it has a couple of knobs, it could be a select-o-ject. If you unplug it and lose audio, it probably is in the audio chain.

And, there is the possibility that someone cleaning up an estate found it sitting on the shelf and the only place it could plug in was in the back of the NC-300.

Sure it does Ray. Just like the two hams on 40 today. One had installed RG8
in place of 58 and wanted to know how much better his signal sounded. I
almost fell off my stool....

>
> Of the racks used, are they full racks or partial racks with storage?
>
> For storage, what do you use...cabinets, shelves, chests?
>
> What do you for lighting?
==========

I use vertical double-slotted wall mounted support strips , such that brackets for desk tops and shelves can be positioned at will also below desk level for extra storage. Larger test equipment like scopes ,variable PSUs , Variac , HiPot tester all sit on shelves. Handheld test equipment is kept in a cupboard.
Desk lighting are a number of 12V Halogen reflector bulbs (encapped in glass ......watch UV radiation,possibly causing skin cancer, when using open reflectors with replacable bulbs) ,fitted on a rail clamped to lower shelf edge
On separate smaller desk where soldering is done I have a circular fluorescent light combined with a magnifying glass (at my age essential for doing sm work)
Components are stored either in wall-mounted plastic drawers or in separate plastic boxes incl those normally used for icecream etc.

Main operating /testing desk is 3 metres (approx 10ft) long ,desk top is 750 mm (approx 30 inches) from floor ,eg slightly higher than a normal table. Reason : comfortable height ,such that when sitting on a adjustable (pneumatic) office chair ,the angle between upper and lower leg is slighly larger than 90 degrees with lower leg at right angle with floor.

Desktop is composite board with 'formica' (hard plastic) lining (in the UK at least) normally used for kitchen tops .Desk top depth is 900 mm or approx 36 inches ,such that with CRT VDU and pre-1990 size transceivers ,there is adequate desk space for (log) book and other paperwork.

Note : The adjustable shelving bracket system enables change of shelving height and distance to suit dimensions of new (test) equipment.
Vertical wall mounted slotted support strips are spaced 600 mm (approx 2 ft) to enable carrying of relatively heavy equipment. The slotted strips are 2.5 metres long . This means they run almost from floor level to a level an 'A4 binder height' above the upper shelf to enable fitting

of matching book supports .Also to fit brackets and shelves below
desktop level ,for extra storage.

Source record: 14229

The FL1 and FL2 ferrite filters in my NC-190 will not adjust to 230kc as specified in the manual. About 227kc is as close as I can get them.
I can't find any info on them. Are they just coils? How do they work? Should I just align the whole I.F. to 227kc? Any thoughts?
I think when this radio was made, it was still kilocycles. I if I align it to khz might not function right. (joke)

FL1 and FL2 are part of the variable bandwidth filter. Did you set the
bandwidth switch to the most narrow position for doing the alignment? Are
you sure your signal generator is on frequency and that you are injecting
the signal at the right location?

The problem is that you were actually putting in 227 kHz rather than 227 kc. You must multipy your measured 227 kHz frequency by 1.0132158 to get 230 kHz.

When kHz was adopted, the World Frequency Commision (WFC) included a tariff of 1.4%, which is stored in the World Frequency Bank and dispensed during emergencies - if any frequencies are running short. This is the reason there is a difference. In your case, those 3,000 cycles must be sent in to the WFC to the world headquarters at Berne, Switzerland.

Speaking of our hamshack clocks, some years ago I had a Seiko that showed time in any of the time zones around the world by a bezel that could move. It was actually a clock nice enough to go on your mantle, as it was in a brushed "gold-colored" case, with smoked plastic sides, etc. I really liked that clock, but in a military move to Korea and back, the movers destroyed it. Sure wish I could find another one, at a reasonable price -- back in teh early '80's, I think I paid around $100 for it.

Yes, they are just coils that are enclosed in ferrite pot cores to make them "Hi-Q". You have found the threaded rods sticking out each side. This is how you vary the frequency of each coil.

The last time I fooled with it, I recall that it had a pretty wide tuning range up and down from 230 kc. Each coil winding has a dipped silver mica cap across it's terminals underneath. I can't imagine those caps drifting in value.

I agree with Don that you should probably align it in the "narrow "position. Is it .6 kc? I think.

How accurate is your test equipment?

John

It is probably seeing the same problem that has been showing up in VFO's
for R390's. It would appear that after enough time has passed, the ferrite
changes its characteristics, and the VFO can no longer be adjusted to be
linear across its whole range.

-Chuck

I have a RCA WR-50B signal Generator which I checked against a BC-221
hetrodyne frequency meter set at 230Kkc. I had previously checked the
internal 2mc crystal in the BC-221 against wwv. I also have a old
Heath/Schlumberger counter with 2 ranges that are too high and too low for
230kc. The high range indicates .230 mhz with the zero flashing 1 and the
low range indicates overflow and reads 29.942
The manual does say to align at the narrow, 6kc, bandwidth position.
Maybe some other external component is affecting it. I also have a hard time
thinking any mica caps have changed value especially since it seems they
would have to increase in value to cause the problem. There's a couple
molded paper bypass caps in the circuit.
John

Hi John:

I have a 190 that probably needs alignment one of these days. I would certainly check the paper caps. Years ago I had an old HT-32 that would not null anymore. I replaced every component in the circuit, yet it was still unbalanced. I finally put in an completely different circuit - which worked great on ssb but gave up am.

Decades later, it suddenly dawned upon me while working on a different circuit that there was a leaky paper cap just outside of the circuit that caused all of my grief.

Sorry about the kHz / cycles bad joke - but you started it.

Good luck, Colin K7FM

John,
Your test equipment sure is classic. (Viva La BC-221). I use one myself. Are you reading the freq directly from the vernier dial on the 221? Of course if you have the book and trust your 221, that should be close enough. But a counter would be comforting.

I have an NC-270 and assuming that the filter circuitry is the same as your 190.

Is your receiver working OK and you're just doing a fine alignment, or are there other issues?

Where are you injecting the 230 kc signal?

Are the two threaded rods in the filter backed all the way out and still won't hit 230 kc? I'm sure you're aligning the other 230 kc tuned circuits along with the filter.

If there has been a change in the ferrite characteristics as Chuck mentioned, possibly those two silver mica caps (3900 pf in the NC-270) could be replaced with a slightly lower value. But I don't think that type of change is likely here. An R-390 linear PTO would seem to be much more critical.

John

> your 190.
>
> Is your receiver working OK and you're just doing a fine alignment, or
> are there other issues?
> It was almost dead when I got it. wireing errors, wrong miswired
resistor in PS, bad 0B2, shorted coax under chassis. had to take a IF c
an apart and bust out a stuck slug, slipping dial. Now it's working but not
perfect. I've got the alignment better than it was. At first I just
peaked the IF's where they were and didn't touch the ferrite filters. Got it
to a point and let it sit for a few months. It seem like other
stations are trying to come in, other than what it's tuned to. I haven't
been able to tell if it's poor selectivity, images or overloading.
Writeing this and thinking about it is makeing me suspect those bypass caps.

> Where are you injecting the 230 kc signal?
At the middle sec of the main tuning cap, the input of the 1st
mixer.
>
> Are the two threaded rods in the filter backed all the way out and
> still won't hit 230 kc? I'm sure you're aligning the other 230 kc tuned

303. Looking for Relays Hammarlund HX50

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-01-12 22:50:40 UTC
From: Paul P <paulREMOVE@REMOVEppinyotREMOVE.com>
Message-ID: <43Bxf.37901$rG5.26441@trndny02>
Source record: 14153

There are two relays in the HX50 transmitter/exciter. They are open frame DPDT 650 ohm coil with both of the coils in series as the plate resistor connected in series to the plate V107 pin6 plate. The output is a single 6DQ5 tube that is capable of CW, SSB at 60w and AM at 15 watts.

Does anyone know of a source for these relays, or a substitute? If not what should the contacts be rated at current and voltage wise? I been looking a Mouser, Digikey and Newark and think I may have a sub. It will need some crafting and skill to work it into the RF section at the antenna connector.

Thanks in advance,
Paul.
paul at ppinyot dot c o m.

306. Hallicrafters S-38A Problems - Need Help

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-01-13 02:24:07 UTC
From: Ka Nai`a <dolfin@gmail.com>
Message-ID: <bbExf.2085$_S7.1915@newssvr14.news.prodigy.com>
Source record: 14165

I recently got a Hallicrafters S-38A off of eBay. I know there are some reccomended steps to do before powering it up but I couldn't resist. I warmed it up and fiddled with it for a bit and got quite a few stations including WWV.

Today I was looking in the back and noticed a lot of dead bugs and dust and stuff so I vacuumed them out with the brush attachment. I plugged it back in and turned it on and as soon as it warms up now there is an electrical hum that is very loud. I tried tuning the stations to see if they came in and they still do but the hum is overpowering the stations and its like they are modulating the sounds together to make it sound like a robot type voice.

I am not sure what I did and I am afraid to do anything at this point since I don't know what is going on.

Does anyone know what happened to this radio and how to fix it?

Thank you,

Ka Nai`a

Ka Nai -

CAUTION: The S-38A is an AC/DC chassis (common with economical tube radios
of this era) - there is NO transformer to protect you from electrical shock.
IF you lack experience in this area, consult professional assistance.
IF you post to Usenet newsgroup: rec.antiques.radio+phono
You may find a restorer near your home to provide repair services (or web
links to other restorers below - such as Brian Ripley)

It sounds like the electrolytic capacitor has finally failed. Electrolytic
capacitors due dry out -- very common give the age of this unit (> 50 years
old).

Some great web sites devoted to Hallicrafters S-38 model restoration and
repair.

Hallicrafters Collectors (and Restorers) International
http://www.w9wze.org/

Phillip Nelson

You may have bumped something with the vacuum brush. There are any number of things you might try:

Take each tube out one at a time and re seat it a time or two.

Turn the plug around.

John

And you have obviously attached some type of antenna wire to the set to hear WWV and such. Make sure that this wire is not attached or touching any metal objects such as metal window frames or other metal fixtures.

Please pay attention to "gb's" comments above about safety issues.

Never owned an S-38, but I know what it is.

Thank you for this information. It'll take a while to go through it all
and figure out how to do the re-cap that a few articles have mentioned.
It has been a long time since I have done anything with electronics. I
am going to see if I can find anyone in the Southern California area who
has done this since some of the diagrams and descriptions are kind of
hard to follow.

Anybody parting out a Drake 2A or 2B receiver?

I need a cabinet and a set of knobs for a 2B that I'm
bringing back to life. It was damaged during shipment
due to very poor packing. The condition of the paint
on the cabinet is not important, as long as the metal
is not dented, bent, or badly rusted (light surface
rust is okay). I'll strip and repaint it. The knobs
need to be good ones with no cracks and decent chrome.

Can somebody help me out here?

73,
Dean K5DH

Source record: 14171

Hi Paul,

I have just got my HX50 running into an antenna last night. Good reports on both AM and SSB on 40m. I had to sacrifice a slug out of one of the 20m coils to get 40m to work. I'm hoping to scour some hamfest in the spring to try and find some slugs.

Previous owner of rig I got off of Ebay had hacked a hole in the chassis and mounted a octal socket over there by the output toob. It looked like a big wart hangong off the back. I junked that relay and just hardwired output to the 259 connector. I use outboard T/R anyway. There is another octal base 3pdt relay over by the audio section which I kept. I think it was homebrewed, but could be factory????

So point is you can run 1 relay if that is ok with an outboard T/R. I know some people want thing to look 100% factory, and I am not knocking that. Keep about 1.5watts on the relay coil and should pull in no prob without overheating. I think the 110vdc type relays in an octal plug in are nice way to go.

Good luck with your rig. I think you said you are working on for your friend.

It's actually a BC-459A but I wouldn't say "badly hacked".The extra antenna insulator and toggle switch added to the front panel are the most obvious breaches.

That mount it's sitting on is certainly a desirable item.

Power connector has also been replaced with an octal.

> That mount it's sitting on is certainly a desirable item.

That mount is missing most of it's pieces, including
the connection box in the back, which is where all
the important parts go.

I'd not buy it myself, but I'm sure someone would like
to have it. I doubt it will sell at anything like
the asking price. But then, what do I know?

The TS-130SE was built for about two years as an economy version of the 130S ..Don`t have the details but ,usually the economy version had all the essentials and virtually the same performance as the original . I guess they were trying to lower the selling price a bit.. Most of the "E" versions in the Kenwood line that I am familiar with worked as well as the regular version,if not better.. GL W4PQW

David,
Ya got me. I missed the octal power socket. And I'm just not familiar with the details of the mount.I know that they are hard to find. I could have almost accepted the extra antenna post if it were carefully aligned.

I'll confess, in my day, I was a Command set hacker. It seems the object was to do anything possible to keep it from looking like a Command set. You should have seen what I did to a nice BC-458 when I built my first SSB rig in 1958.

Luckily, I still have a clean BC-455 and 459.

Ka Nai,

As I previously posted, this is an AC/DC transformerless design --
it would not pass current safety standards for mfg. without at least a
polarized plug .. and more likely a 3-wire plug to increase overall safety
to user.

60 Hz hum can also occur if you have accidentally "flipped the AC plug" --
this
plug is NOT polarized.

Hi Dean,
Sorry to hear of the damage to the Drake.
If you end up repainting (and you likely know this) use a Rustoleum Auto Gray Primer over the bare metal and follow it with Rustoleum satin black #7777- a very nice match for the 2A/2B- perhaps 2 coats with wet sanding in between to remove any dust/dirt. MY painter lost my silk screen and artwork for the 2B, so no more front panels.

Hi Gang:

Well time to clear out more clutter.....here are three
copies of the British equivilent to ELECTRIC RADIO -
Radio Bygones. Three issues, Issue 92, Christmas (DEC/JAN)
2004, Issue 93 Feb/March 2005 and Issue 94 April/May 2005,
This is a very interesting and well-illustrated magazine. There is a
fascinating two-part article called German 'Amateurs" in WW-II.

I am asking $8.00 plus postage for them. They normally cost about
$6.00 per issue or $38.00 for an annual subscriotion consisting of
six printed issues. . If interested please reply by e-mail.

Warren -

IF you are referring to the base section with insulator, a replacement base section (for current model) for Cushcraft -- price was over $100 - last time I checked.

The fiberglass base insulator is an epoxy-coated tube. The epoxy surface has the tendency to "evaporate" and the bare glass fibers then are like a sponge attracting absorbing dirt and moisture. CONSULT PA0FRI web site link below for easy repair of this situation.

IF the fiberglass tube has cracked .. you will need facilities / equipment to "press fit" the replacement insulator tube

I would recommend either fiberglass tube from a supplier (e.g. MaxGain) that carries fiberglass tube
http://www.mgs4u.com/fiberglass-tube-rod.htm

OR the usage of Delrin.
Rick - WA6JKH uses solid Delrin rod for his GeoTool antenna product

Hi Group, I am entertaining building anohter regen. My first attempt, although pretty, was a mediocre performer- using a 3 section compactron tube.
http://parelectronics.com/pics/regen2.jpg
Design goals are:
1. plug in coils for band changing MW-20 MHz or so.
2. speaker level audio
3. smooth regen
4. prefer miniature tubes to octal.

Anyone care to post their favorite schematic/ links/ thoughts?

Tnx,

Dale W4OP

I'm guessing that thats the one from the GE book? I've not built that one but have heard mixed reviews.
If you really want to build a stable and manageable kick-butter go regen/superhet. The Regenodyne in its various iterations can be found on the web and is highly recommended.
I'm just now winding up another revision of the George Grammar rig from 1941 with some added audio stages. I'm tickled (pun) with it! Another one that is likeable is the ARRL SimpleX Super. I like old stuff and have thoughts of building it with octals and plug-in coils :)

GL,
Bill

I have a "Science Fair" Regen receiver here which does the AM broadcast band
to 30 mhz. Personally, I think it sucks, but that's my opinion. I acquired
the full manual for it and am contemplating putting it up on E-Bay for
someone who may like Regens to play with. It "may" need the tuning touched
up a bit, but "I" don't have time. It's sat on my shelf for 99.8% of the
time I've owned it.

A few years ago I had a notion to figure out why most kit regenerative receivers just didn't work, despite their reputation for great sensitivity, bla bla bla.

I looked at a few schematics and a few points really jumped out at me. Basically, most standard Heathkit/KnightKit circuits are just Hartley or Armstrong oscillators with variable plate or screen voltage, provided by a potentiometer.. At first this sounds reasonable, but the goal of a regenerative receiver is really that it NOT oscillate.

Most of the circuits have 2 fatal flaws, both of which lead to the same result. The 2 flaws are grid-leak bias and resistance coupling to the following audio stage. The problem is that these techniques cause a shift in tube operating points as the signal strength changes, making it "snap" into oscillation. This occurs because any signal, or impulse, or anything else that drives the grid instantaneously positive causes grid current to flow and charges the grid capacitor, biasing the grid negative and reducing the plate current. This wouldn't be so bad except that the reduction in plate current causes the plate voltage to rise, due to the coupling resistor in the plate circuit. As the plate voltage increases the gain increases and the thing snaps into oscillation, ready or not.

I put together a test unit using the Armstrong (tickler) circuit, but I used NO grid condenser or resistor. Instead, I returned the grid circuit to a 0-20 volt regulated power supply (properly bypassed for RF, of course)so I could control the grid bias manually. Also used choke coupling, actually the primary of an output transformer in the plate circuit. Used a 6T4, and the circuit would still work even with plate voltages below 30 volts.

I didn't fool around with it too much after I proved my point, but the thing really did work pretty well, far better than any "kit" regenerative I have ever seen. With regulated power supplies I could get some real sensitivity and a smooth roll into regeneration. I was impressed. Never did make a real project of it, but it was a good experiment.

If you go back and look at some of the pre-historic regenerative circuits you will notice the same concepts at work. Most were choke coupled, and many used variometers or "throttle condensers" to control regeneration. Again, these techniques do not allow the DC operating point of the tube to change with variations in signal strength.

Just food for thought.

Hi Dale:

I have built a number of regen receivers. One of the great ones is in one of the "How to Become a Radio Amateur" pamphlets. It was also in QST and maybe in some of the Handbooks. It uses 2 x 6AQ5 tubes and can run a speaker directly.

Regeneration is controlled by a pot in the screen and it is very smooth.

Fits all your requirements. If you need more details, I have the bbok upstairs. I can get the QST date if that helps.

73, Colin K7FM

>Hi Colin,
Nice to hear from you- if you have a title, and it made it to the Handbook-
perhaps I have it in one of the vintage ARRL Handbooks- otherwise, date of
the article will be helpful.

The complete construction article also appeared in the 1964 edition of "How to Become A Radio Amateur." Don't know if it ever appeared in the Handbook.

I do have a copy of the article, but not handy. If you can wait 10 days or so I can scan it for you.

Hi, Dave

Does the Dovetron have a USB/LSB switch,
or can it be switched remotely? (My HRO-50 is rack mounted,
so no easy access through the top of the receiver).
Also, does it provide a good AGC system?
Audio derived AGC? Can you point me to a schematic?

Thanks,
Ed

Paul,

Just checked the relay. It's a P & B, and printed on top is:

KCP14
plate circuit
5000 ohms

Mounted just forward of the power transformer, and next to one of those
big 600v HV supply caps. I used a 12k or 15k in series with it. Works
FB.

You have nice site Dick. I especailly like the links and the nice
Heath price information.

I recently finished modifying a DX 60 for my Friend Lance WA1IWI. I
did the K4TAX mods which can be found at amwindow.org My friend has
gotten some very good audio reports with mods.

I have about a dozen pieces of Heath test gear. Most of it works, and
a few pieces I will get too soon.

I have you in my favorites file and will keep you in mind for manuals.

thanks

How about a regenerative superhet? Maybe use a triode/pentode tube as
a converter in front of a regen detector running at 2 or 3 MHz. If you
wanted full coverage the L.O. of the converter would be an LC
oscillator, but for ham-band only you could use a crystal oscillator
for more stability. Might be something like

6EA8 converter (triode oscillator, pentode mixer)
6EA8 detector & first audio (pentode detector w/ screen voltage
control, triode first audio)
6AQ5 or 6CU5 audio out (6CU5 will give more audio at lower B+, 6AQ5
more at higher B+)
OB2 regulator for the 6EA8s

Message-ID: <bhuyf.5346$WY5.3633@newsread2.news.pas.earthlink.net>
Source record: 14113

The regenerative superhet described by Mike is a good idea. it is known as the "super gainer" and was pioneered by Frank Jones. They are described in the 1938 Radio Handbook. The converter in front of the regen receiver substantially reduces radiation by the receiver and also eliminates the effect of a swaying antenna. By setting the fixed if between two amateur bands, both bands can be covered with one oscillator coil. The drawback is an increase in parts count .

For some, simplicity becomes elegance. There is nothing like honing your skills during a gusty evening, where the open oscillator coil changes pitch with each puff of wind and your movement around the room. For those, a digitally locked oscillator is heresy.

Not really. The sx100 was a general coverage receiver, sold for $295.
The sx101 was ham bands only and sold for $395 in the late 1950s.

By comparison, the hallowed sx88, in production in the mid-1950s, sold
for $595.

What's your point?

Are you saying that you have spectrum analyzers (which you say are
garbage) that you want to get rid of, or are you saying that you'd
like someone to dump a spectrum analyzer into your garbage can?

Thanks for these links as well. I will probably order the caps from Bill Turner. I replaced the cord on my unit with a polarized plug from a black extension cord.

The hum came from a cold solder joint that was knocked loose while I was cleaning it up. So I resoldered that and a few other questionable ones and it is working again, but still not using it. I am going to try the recap soon so hopefully by the end of january I will have that part finished then I need to work on the looks of it.

I posted a pic of mine to a photo contest site just to see if it would win. *LOL* But if you want to see kind of the condition its in here is the link.

http://community.wirelessgalaxy.com/photocontest/view_picture.asp?id=243

Someone e-mailed me saying that he might have the kobs I need for it.

Extensive AGC mods are part of the change and work very well. USB and LSB is selected by the variable BFO so no real change there. I can send you the 75A2/3 instruction and schematic if you wish. Looks like the plug-in is the same for Collins, HRO and NC-183D. You would be on your own for the actual radio mods which could be extensive. The plug-in socket gets rewired as well as numerous other mods.

FS: Original Manuals (not copies):

Drake TR-4 Sideband Transceiver - also covers the Drake RV-4, AC-4 and
DC-3 - $15
Morrow MB 560 Transmitter - "Compact, Mobile or Fixed Station, Phone or
CW Transmitter" - $5
Hammarlund HQ-120-X Communications Receiver - good condition except for
stain on back outside cover - $8
Heathkit HW-8 Low-Power CW Transceiver - $15
Heathkit HWA-7-1 Accessory Power Supply (for HW-7 and HW-8 QRP
Transceivers) - $5
MFJ 1270B/1274 TNC2 Owner's Manual with TNC-2 Upgrade Kit Manual - $2
for both
SBE model SB-34 Manual (missing the front and back covers) - $3
EICO 717 Electronic Keyer Assembly Diagrams (no manual) - $2
Collins "S-Line" Series Amateur Radio Station Logbook (unused) - $15.
This is the older one, with the drawing of the "S-Line" on the cover,
not the later version one with the actual photograph.

Manual Copies (not originals):

Johnson "Navigator" CW Transmitter (W7FG Vintage Manual) - $5
Drake TR-7 Transceiver Operation Manual - $2
Swan model 250C 6-Meter SSB Transceiver Operation and Maintenance
manual - $1

"Flying Horse" Callbooks: - all four for $2

Summer 1974 United States Listings Magazine (update to the original
1974 issue)
Winter 1972/73 DX Listings
Summer 1971 Foreign Listings
1982 Foreign Listings

Prices shown do not include postage via USPS Media Mail (least
expensive).

The OP posted that he was thinking of getting rid of his
spectrum analyzer, and was wondering if there was some inherent
use that, as a hobbyist, he might of missed.

#0 was a reasonable response to this request for information.

#1 says they are garbage in faint hopes of convincing the OP that
he should get rid of his spectrum analyzer.

#2 echoes #1, and offers up a garbage can for the OP to put his
spectrum analyzer in.

#3 plays the straight man, and wonders if the "really nice garbage can"
can do phase noise measurements.

#2 plays the comic, and implies that if someone puts a
spectrum analyzer (the right kind of garbage) in his garbage can,
then his garbage can will be able to make phase noise measurements.

Bah duh BUMP! (the sound of the ever present drum in the club band)

I didn't think that you would be so humor impaired that you would
miss the meaning of this simple thread. This is just plain old
ham banter the likes of which is heard daily on the informal nets
on the ham bands, or at hamfests everywhere.

-Chuck

Don't be too hard on the guy. This kind of humor depends heavily on
voice inflection, something not easily done on Usenet.

Bill, W6WRT

Between the web sites and resources that I provided .. you should be able to
get it going. Since you are suing a polarized plug, NOTE Brian Ripley's
comments about rewiring a couple of safety points -- Change power switching
to the HOT AC lead and not the NEUTRAL/chassis lead
http://www.thes38guy.com/Page_2x.html

AND new safety capacitor on AC line.
http://www.thes38guy.com/Page_9x.html

You can contact Bob Piekarz, Bob's Antique Radio & Electronics (LaGrange
Park, IL)
http://www.radioantiques.com/mall.html

When I talked to Bob last year, he had a couple of Hallicrafters S-38
repainted and silk screened (looking brand new). You might ask him ... who
did the silk screen work for him (and if they still have the S-38 silk
screen).

Bob also has the multi-section capacitors made by Bill Turner
http://www.radioantiques.com/supplies.html#caps

The SX-100 is a classic radio. Same basic design as the SX-88 - and much slimmer. It actually fits nicely on a shelf that is not too deep. It uses the 50 kHz if strip and has great selectivity. If there were only a few receivers around, it might be a very valuable receiver. But, it is fairly common. The demand is higher than on the SX-101, so the price will normally be a slight bit higher that for the SX-101. In terms of performance, the SX-101 is a ham band only SX-100, with more mechanical stability. Mechanical stability on the SX-100 is terrible, thanks to the otherwise wonderful gear drive system. On 15 meter cw, with full selectivity, you can drop a pencil on the desk and lose the station. Nevertheless, it is a classic radio.

I bought one in excellent condition, with a nice Hallicrafters speaker for $100. Also bought a basket case SX-100 for $35.

How someone else spends their money is their business.

Back in the mid Fifties or so I visited a fellow ham across town. He was a Novice at the time and had a Heath AR-3 receiver and WRL Globe Chief transmitter. And I thought he was a rich kid then, as he had all new commercial equipment. Most everything I had was homebrew.

The next time I visited, he had his General ticket and had an SX-100 receiver and B&W 5100 transmitter. Do you know how much that stuff cost in the mid-late Fifties? He WAS a rich kid.

Part of the demand for the SX-100 is that every young ham in the late 50's saw the gorgeous SX-100 on the back of every ham magazine and in the back of the ARRL Handbook. Other kids had pictures of Marilyn Monroe tacked on their wall, but it was the SX-100 that drew the attention of the young ham.

Decades later, when these same hams now have enough money for the essentials, they at last can purchase their SX-100 and let it sit on the shelf of their shop. In terms of performance, the Drake 2B will beat it hands down - but the 2B does not have the aesthetic appeal and was not the object of affection for young male hams.

Yes it is their business, but we are entitled to comment if we wish. I was dumb enough to buy an SX-100 new, and it was so mechanically unstable I couldn't use a key or bug on the same table as the receiver. I sold it as soon as I could afford a different receiver; an RME if I recall correctly.

The SX-100 was junk in the 60s and it's junk now.

Don

I had a low-end National SW-54 as my first receiver. You could breath
on it and lose a CW station. I ended up getting one of the little
ARC-5 surplus receivers; bought it for $5, made it work on 100-v.AC
for another $20; you could bang on it with your fist, and the CW
stayed rock steady. I lost that little receiver sometime in the 70s,
much to my dismay...

The SX-100 went for $1700 and change on eBay...

An unbuilt Heathkit 2060 tuner went for $545; I was beat out by ten bucks. Damn.

Geez, John, even _I_ got it! Guy A says, "My scope is garbage." Guy
B says, "I have a nice garbage can", which implies (at least it did
```

to me), "Go ahead and throw it this way!"

Admittedly, not the world's greatest humour, but I don't think it was meant to be taken so seriously as to spoil anybody's day. ;-)

Cheers!
Rich

It looks like xray said, "Spectrum analyzers are OK", then Paul Burridge said, "No, they're garbage", then clifto said, "I have a nice garbage can" as in "toss it this way! <leer, snort>" ;-)

At least, thanks for maintaining attribution here so I could 'splain it to you. :-P

Cheers!

Very smooth regen control. Except for the plug-in coils requirement...

Though I realize the feedback windings would be problematic to reproduce...I listened to many 40M SSB QSOs on Saturday mornings with the Knight Space Spanner.

Perhaps LA5KI would consent to doing some measurements on his coils...

I have for sale a nice Malcomized Yaesu FT-102 Station:
1. FT-102 fully Malcomized by Malcolm Eiselman, NC4L, with little use since work was done 8/26/03. Over $600 charge. Transceiver has AM/FM Board, XF-455C CW Filter not installed, Handmic, Power Cable, Original Manual. Works great, 200 watts out. Cosmetically, it is very good. It does have a few small
scratches around front trim, but not bad. Front Panel and Cabinet are in great condition. Also has 455 IF AM Filter installed.
All documentation from Mal included. Price is $775;
2. FV-102DM Synthesized digital VFO with Memories. Very stable. It has also been gone over by Malcolm in Dec. 2005 and works perfectly.
Cosmetically, it is very good. It comes with original manual and all cables. Price is $375;
3. FC-102 Antenna Tuner. In as new condition with Original Box. Works Perfect and looks new. Meter lights work. Comes with Original Manual and the cable for the the meter lights. Very little use. Price is$325
Shipping from 79602 extra. Package price for all items listed is $1375.
Digital Pictures available. Thanks, Charlie Hugg, K5MBX

413. NC-300 Calibration Question

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-01-19 00:26:27 UTC
From: Cincinnati <none@fuse.net>
Message-ID: <817bc$43cedcb4$48317ba4$13131@FUSE.NET>
Source record: 14063

I am trying to calibrate a NC-300. All bands are 10-20 KHZ high. I have trimmed the respective capacitors to minimum and am still high. Manual says respective coils are adjustable but they appear fixed.

Q1: is there a general reason or fix for why all bands are high out of range?

Q2: Is there a way to adjust the coils?

If responding direct use:

hamguy (at) fuse.net

Thanks

Ron Schuster N9RC

Always do a "mechanical alignment" before doing an electrical one.
That is: check for loose couplers between the dial drives and caps,
make sure the dial pointer physically stops at the correct points at the
rotational stops... That the tuning capacitor plates are fully unmeshed
or meshed at the rotational stops (or as shown by the manufacturer).

The Trimmer caps SHOULD allow you bring the high
end of the bands into calibration regardless of other issues... The low
end of the band alignment is usually set by the coil slug(s).

AND the coils and caps interact: if you adjust one significantly, you have to re-adjust the other. ALSO: if you are doing this with a sig gen, make sure you are locking onto the actual freq, not some other mixer component (happened to me).

Interaction, true. However, if I recall, adjust the low end (coils) first.
The trimmers have least effect at the low end where the coils have effect
everywhere.

Starting like this usually means you won't have to do but this once. This is
predicated on the assumption that you are starting with a radio that has
been previously tuned and just needs touch-up; because the trimmer will be
"close".

Hi,

I'm going to have some wood cabinets build to closley match those that could be purchased for the Hallicrafters SX-11. I am in need of cabinet mesurments and pictures. I'm especially interested in what the back of the cabinet looked like. Can anyone out there supply pictures or a source for same?

Thanks,

Jim

The schematics show the oscillator coils for 10 through 80 are slug tuned,
but it appears the 160M coil (T9) is not.

Do you have the manual? If not, the .pdf at the BAMA site is fairly good.

Don

Sounds like a scam to me! What if I send you a dollar and insist on
medium rare and the next guy who sends a dollar wants well-done? Are
you going to decide? Will you be sending our money back?
Sorry, I see this as only leading to problems. I'm not falling for it.

ceramic coil forms of the oscillator coils is a half turn of heavy wire that you bend up and down within the cylinder of the form to aid or buck inductance. Very stable good idea from National who, as I now find out, had a much stabler almost drift free vfo with ceramic coils. (Unlike Halli)

I've got a coil here...not sure where it came from...possibly an LM or
BC221 freq meter that has a little internal winding on a mainspring
gizmo that rotates according to temperature. Quite clever.

I have posted the schematic and parts list of a 50s regenerative receiver (224 K) on a.b.s.e., which I received from Colin, K7fm, This receiver has been discussed on boatanchors.

It is part of a construction article, now a 4.7M pdf file, which I will post if there is any interest for it. The project receiver is fairly typical of what someone in the 50s might build as a shortwave listening receiver, or for a beginning ham radio receiver.

To pique your interest, the detector uses what is a modified Hartley circuit using an unusual selection of tube.

In the .pdf file, there is a 5Y3 tube power supply schematic, of 50s overkill design.

Don

amdx, still there are enough of the young guys and girls that are ignorant of the Ponzi type scam and buy these worthless software packages that annoy us all on a daily basis. I'll admit that some old fools also buy into these 'get rich for free' scams, however most of the seniors realize that nothing comes for free.

I simpy look at my junk mail file on Yahoo and pity the poor person that has been misled into buying into one of these scam products (the software, not the scam itself).

Naturally, from my curmogenous viewpoint, anyone that buys into these software scams is so stupid that they require treatment. Those that respond to the canned pratter that their software posts are so brain dead that they are beyond hospitalization and treatment.

Sometimes it is educational to read their patter. For example, on one day I received 5 junk mails sent by five different individuals, with identical text content. Evidently, they were all scammed by the same junk mail software seller!

I must have a perverse mind, because I find that funny.

Curmudgeonly yours, Harry C.

Same here Cecil.

The young kids don't have a clue about Social Security, because it isn't important to them at their time in life, nor was it for me when I was 25. None of us ever thought that we would live to see 65, hence it was just like income tax, something that you simply had to pay.

The problem is not for us elders, but for the younger people who will hopefully someday reach 65. Today, most of these kids don't realize is that the fault with the Social Security system is not in its basic design, but what I beleve is called SSI that allows anyone regardless of age to claim benefits unser Social Security by claiming some form of disability, even if they have never contributed to the system.

Just as an example, when I went to the Social Security office to claim my earned beneits, I was the only American present in the waiting area containing roughly 30 applicants. Most of these individuals were there seeking SSI benefits, few were American citizens, and most had never paid a dime into the system. This is precisely the problem that Social Security faces.

No wonder Social Security is in trouble. It is comparable to a corporation that pays dividends to people that don't even own stock in the company!

'Nuff said on that subject.

Curmudgeonly yours, Harry C.

A class on consumerism ("they want to take your money") should be a
required
class in middle school.
And don't get me started on all the bogus, weight loss products, grow tall
products, second grade teacher developed common cold product, herbs that
will stop diabetes and
heart disease, anti hairloss products, improve your memory, shrink your
prostate, grow penis, cleanse your blood, detoxify your liver, give you more
energy, stop your joint pain, make you more appealing to the opposite sex, ,
improve your eyesight, slow
the ageing process, improve your circulation, make exercise easy, prevent
cancer, make
your skin beautiful, health restoring magnetic shoe inserts, magnetic water
enhancers.
I think you got me started ;-0
And speaking of curmudgeons, Andy Rooney said
" Happy birthday?--I DON'T THINK SO."
Mike, I promise to enjoy my day! Bye

That will be great. I think there is a better tube for the detector, but I
haven't pulled the charts yet.... 6BA6 comes to mind. Besides, 6 Boat Anchor
6 sounds fitting.

I have a RF-505 solid state receiver for sale. It tunes from 1.6 to 30Mhz but will receive down to 100khz with lower sensitivity. It tunes via 100hz steps with rotary knobs with fine tuning via the 1khz knob. First IF 156Mhz, second IF 500khz with USB, LSB, ISB CW and AM modes. Price is $325 plus shipping from zip 07737. Pictures on request.

Thanks,

Mike N2MS

Source record: 13999

Gents,
I am restoring an HX50 for a friend. It appears that someone has modified L115 (wrapped around R181, 47 ohm 1w) by altering the amount of turns in two ways.

1) Inspection of the solder ends where the inductor (L115) is soldered to the resistor's lead wire appears to have been changed. Extra overlapping wire, as though someone shortened the total length of the inductor's wire, has been adjusted and soldered to the resistor's lead wires.

2) Solder blobs have been placed on the inductor as to short out two of the turns.

Please see pictures at the bottom of page:
http://www.ppinyot.com/hammarlund.htm. Sorry for the fuzzy blow ups. I do not have a close up Macro lens available at this time.

Can someone tell me the proper quantity of turns the inductor L115 should have, wrapped around R181, 47ohm 1w resistor? And/or send me a picture of an operational unit?

It would be a big help to have this worked out before +700v, alignment and calibration.

Thanks,
Paul

Wow there GBrown,
Don't blast Harry C. He has a point. Up here in the great white north
known as Canada, I have seen deadbeats claim Social Insurance.
They do nothing to contribte to society, they just wait for 'check day'
to pay the rent, and blow the rest on beer and drugs only to be broke
in a day or two until the next month*. My taxes go towards paying them.
Is that right? I think not. Is it the same in the states? If one day I
need to
do the same, rest assured it will NOT be wasted on beer and drugs. I
have paid into this for many years. I would just want something back
from
all the $$$ I had deducted from my pay should I ever need it.
Tom the Canuck.

* Do they eat food? Utilities? I do not know and do not want to..
What they do for the rest of the month is beyond me.

GBrown, the fact that they couldn't speak fluent English may have prejudiced my conclusion. It isn't very clear to me why the Social Security offices need interpreters. After all, anyone who has been in this country sufficiently long to seek Social Security benefits should at least be conversant in English, since that is the language that is spoken here.

When you see many people who appear to be under the age of 30 and cannot speak fluent English seeking SSI benefits, the red flag should go up for everyone. Where is the Green Card? Damn, what was wrong with the Ellis Island immigration procedure, and why did the US eliminate it? At that time your entry into the US was judged on your health, skills, and ability to provide for yourself and your family in the United States. During that era, no one came to the US for a free lunch, unlike today.

Realize that unless we secure our borders and return to the strict immigation policies of circa 1910, the US will become a human dumping ground for misfits from the balance of the world, and constructive citizens will no longer be able to support it and flee to other nations who, for the above reasons, close there borders to other than those that can contribute significantly to their country -- and for good reason.

I am pissed off because some of those "new arrivals" are immediately able to collect larger benefits from Social Security than I who have been paying into the system for more than 50 years! Yet, we wonder why Social Security is about to go bankrup! Dhuh!!!!

Sorry for the curmugenous attitude, but the pot of US money has limitations, and I believe that it should first be utilized for the benefit of US Citizens who have contiributed to the system for many decades, and not be wasted on on freeloaders who have obviously never made any contribution to the system.

Curmudgeonly yours, Harry C.

Hey John,
I like your post. Good idea.
What about those telemarketing companies that sell
worthless products from Canada to the US?
There is a telemarketing company in the building where
I worked. Being a smoker, I got to know a few of the
frequently replaced telemarketing sales staff.
The company in question sells a 'directory' of businesses
in the states. While smoking, I asked one of the sales people
what the product they were selling was good for. The reply
was toilet paper. I would tend to agree. I believe there were
several complaints to the attorney general of a particular state(s)
and I had a smile on my face when the local police raided their
place of business. Too bad they were back up and running the
very next week. How can we stop these assholes? It puts a bad
name on Canada. I feel ashamed that they can operate freely here.
Tom the Canuck.

Harry, I understand your point, completely. I was getting at the fact that how are we to judge who or who isn't eligible for SSI. I worked all my life and it wont be long before I can step up to the SSI office and sign my forms. I wish there were a way to weed out the imposters but you have to start home. There are people in this country, citizens, that take full advantage of the soft hearted liberals and reap the rewards. I really don't know if there is a good fix to and old problem.

There is an interesting quality about using the 6AQ5 tube, since it normally is not used in receivers - except for audio output. Like the Mosley receiver, only one tube is needed to be able to replace any bady tube. The 6AQ5 is somewhat unusual, however, in that it connects pin 1 and 7 together, so there are few drop in replacement tubes.

The 6BM5 would be a drop in replacement with more gain. One other tube should work as a drop in replacement - the 6BE6. Instead of pin 1 and 7 being connected, they go to separate control grids. Have not tried it, but I think it will work.

6AQ5 tubes are still plentiful and cheap and it gives you something to talk about if you get tired of talking about the weather. Here in NW Oregon, we just say rain and then move on to something else.

amdx, you posted:

"And speaking of curmudgeons, Andy Rooney said
" Happy birthday?--I DON'T THINK SO."

I must have missed seeing Andy say that, but it's so true that it made my day! Thank You!

I believe that it's somewhere after the age of 60 that the "Golden Years" are said to begin. In reality, the "Golden Years" consist of stays in the hopital where various parts of you are being removed. For recreation you begin to give things that were once precious to you to good friends. You worry about gas and electric bills, and tax bills, that essentially double yearly, and you're on a fixed income consisting of Social Security and a pension fund (if you have one). One day you realize that you're nearly 70 and no male member of your family has lived for more than 72 years. You still have a sex drive, but your wife hasn't since menopause. Then you realize your mortality and begin to complentate methods of disposing of your remains that don't present a burden on your family, like donating your body to science. When you go asleep at night, you wonder if you will wake up in the morning, since you hope that when you die it will be painless and in your sleep.

On the positive side, what helps to keep my spirit alive are both my Masonic and fireworks friends who both inspire me to accomplishments and dreams, as minimal as they may be. The computer helps a great deal, because the Internet has become what I had imagined 40 years ago -- a vast source of information.

Then too, I have again pontificated far too much, and if you are approaching the, welcome to the Golden Years! :-)

I would just remove the solder blobbed winding and replace it with the same gauge wire with the same number of turns as the original. Perhaps time for a nice, clean new resistor as well.

It's a parasitic choke to suppress VHF oscillation and should not be that critical.

Just replicate the original and everything should be OK.

John

Why kill yourself when you can stay alive and fight this crap.
No need to resort to physical violence (I don't like the idea)
but instead use our intelligence to fight back.

Why not swamp the offender's inbox with e-mails.

SUBJECT: "How to make a million dollars easily from your home"

INSTRUCTIONS (body text):
Send me $2.00 by mail and I will send you complete instructions to be rich
quickly.
Please include a stamped self-addressed envelope.

(IMPORTANT: Get a PO Box for the address)

Your snail mail reply:
"WHAT TO SEND TO SUBJECT ON PAPER (they paid for it):"

SNAIL-MAIL SUBJECT:
(use this for your e-mail)
How to make a million dollars easily from your home

What to do to start::
SEND THIS E-MAIL:
Send me $2.00 and I will send you complete instructions to be rich quickly.
Please include a stamped self-addressed envelope.

{Insert your address here}

WHAT TO DO:
Mail the above paper message when you have $2 and envelope.

-

This can also work if you take out a classified ad in a local news paper.
There should be at least 1,000,000 morons in a large metropolis. Just send
the

same info but change it to say 'take out a classified ad'.

-

Why not sell 'solar powered cloths dryers' for $50.
Ship the sucker a cloths line. Technically you are not
in the wrong. It is 'solar powered' after all, unless it is
a cloudy day.

-

Give back some crap to the target who has been cross posting to various NG.
I was amazed to learn I posted to rec.radio.amateur.* groups. Your replies
were
there as well. I may check them out, it has been a long time since I made an
FM
transmitter.

==========
{back to pyro for a moment}

Just a thought, I know about the electric firing panel for pyro displays.
Lots of wires and switches. Is there any need for an RF ignition system?
It could cost a few more $$$ but you eliminate the long run of wires from
the
panel to the pyro items you want to ignite. A secure comm protocol would
prevent ignition by 'outside' sources. A laptop could be added to control
the
timing of events.to be fired. A simple User Interface to make it moron
proof.
What do you guys think? Just looking for ideas. Start another thread if you
like the idea. We can discuss details. I have made embedded systems for
about
the last 20 years. This idea is possible.
==========

Sorry, feeling a bit malicious tonight, (===pyro thought not included===)
Tom the Canuck.

P.S. $2 will NOT work in Canada.
We have those $1 and $2 coins to deal with.
(Maybe up the cost to $5 CDN)
$50 should work out just fine.

Mr. GBrown,
In a sense I do not care what creed, colour, or nationality a person
comes from.
We are all human and live on this tiny blue marble called Earth.
{yes there are assholes in every group, even yours, ignore them, I do}
Let us judge by what a person does, not where they come from. Does it
matter?
If you contribute to our "society" (needs improvement) they are fine, if
they live off
the labours of others I object. Perhaps we should adopt the thinking
that we are all
one people on this planet. Are you going to blast me because my parents
came from
Estonia? (If you don't know where it is, look it up)
Ignorance and prejudice are rampant on our planet. Can we not do better?
What about your "equality and liberty for all" in your constitution? Did
that include
owning slaves from Africa? Open your eyes, see the world for what it is,
embrace
other ideas from other cultures and learn from them. Tunnel vision is a
downfall for
the existence of mankind.
This is what I think, you may thing otherwise. I can not stop you from
thinking the
way that you do, you can not stop me from thinking my way.
Tom the Canuck.

It could be the choke had too much inductance on 10 meters,
and the resistor showed signs over heating; or even parasitic oscillations
could have caused issues with the resistor overheating. Most hams
would "tinker" with the circuit in an attempt to stumble on a "cure".
I'd wonder if the orignal plate chokes are still in place?

FS:Bird Model 74 Coaxwitch **NEW** 6 Position Coax Switch

I am selling a hard to find Bird model #74 6 position "N" connector
coax switch, called the COAXWITCH. Designed for commercial service.
Has minimal insertion loss. Pull out, turn and push in type switch
handle. Sure locking and tight connection. It is new and unused in
original box and packing with instructions.

Pictures at:
http://mywebpages.comcast.net/ï¿½mnowlen/bird-74-front.jpg
http://mywebpages.comcast.net/ï¿½mnowlen/bird-74-back.jpg
The cardboard is part of the packing and has never been removed.

Useful Freq Range: DC to 10 GHz
Max RF Voltage: 500 VRMS (Note: this is 5KW at 50 ohms)
Atten to unused Channel: 75dB

Frequency VSWR Loss (dB) Max RF Power Rating (Watts)
100 MHz - 0.02 850
1 GHz 1.06 0.09 200
4 GHz 1.3 0.22 75

Original cost is near $500.

$150
+ $10 Shipping in Continetial US

Thanks for reading.
Please e-mail replies,

Mike Nowlen WB4UKB

The kit is in excellent, near mint condition and appears to be
complete with all documentation.

Manufactured by The Heath Company, Benton Harbor, Michigan.

$200

Includes shipping, packing and insurance in continental US via FedEx
Ground. Outer shipping carton and additional packing will be
supplied.

Email me if you need more details or specific information:

Anyone have a need for a Transformer out of an older Tek scope? I can't recall the exact model it came from off hand, but there are numbers on it to identify it. It was removed out of a working scope - scrapped only due to no space.

This thing is heavy - if interested - you pay shipping and a very low price for it. I'd hate to just toss it.....

E-Mail to: Info@clfurent.com

Also have various other items available. Inquire with needs.

Being across the Big Muddy from you, I can relate to the rain comment.

I like the 6BE6 for lots of things. I used it once to add a product
detector to my 75A2 many years ago, by replacing a 6BA6 with it and then
doing some very minor rewiring.

Don

I always answer them really loud, then I tell them to hold on while I get my hearing aid. Wait about 5 minutes and say hello again really loud. If they are still there tell them the batteries are dead and to hold while you get new batteries. Wait 5 more minutes and once again loud hello, if they are still there cuss and say you got the wrong batteries and their not working...

You get the idea, totally frustrate them. I have never had one wait beyond the initial getting the hearing aid.

Ya know,
I remember the original article in QST about this 6AQ5 regen set. I still have the magazines but can't remember the exact year.

I recall in the first paragraph, the author stated that, "some eyebrows may be raised at using a beam audio tube for a detector". And as I recall, he explained why. He just tried a number of different tubes for smoothness of operation, and the 6AQ5 won.

I built my first two tube blooper in 1954 and used a 6J7G regen detector and a 6C5GT one step AF amplifier driving a pair of Trimm 2000 ohm headphones.

It worked great and covered 80 and 40 meters.

Sometimes I let them get all the way through their spiel, then I tell them that it really sounds great and that if I ever get well enough to go back to work, I might be able to buy it It really pisses them off. ;-) Other times I just tell them right away that I am 100% disabled, and in too much pain to put up with them. Of course, being on the national "Do not call list" stopped almost all of those irritating calls. The only problem I have is some deadbeat is, or has given out my phone number when they bought crap on credit. I keep a list of these calls and if I get a second call from a company I scream at them while demanding that they leave me alone, or I will have a lawyer on their ass for trying to collect someone else's debt from me.

The only ones too stupid to listen was "Countrywide" which was some kind of mortgage or lending company who had someone different call each time, from different phone numbers. They finally left a message on my answering machine with an "800" number stating that it was an emergency, but didn't identify themselves. It was their headquarters, and I really tore into them, informing them that I had repeatedly told their phone monkeys they had the wrong phone number, that I was a 100% disabled veteran, and that I was not going to put up with even one more phone call. I laughed and told them that if I did get one, that I would call friends at a TV station to have their local office investigated by their news department for violating a lot of different laws, and that I was going to turn over my hand written logs of all of their calls, along with their misleading telephone message. I asked what they thought that would do to their business in the area, just before I hung up my phone. I never heard from them again. :)

I dont post here, mostly over on rec.antiques.radio+phono, but thought I'd note here I have a bunch of RF and military type tubes on ebay, not stuff I normally sell for antique radios. Here is a link to one listing:

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=5856523808&rd=1&sspagename=STRK%3AMESE%3AIT&rd=1

if these dont sell , please make any offer on this or any other lot I have up now. I just want to clear out the piles. If you are looking for any industrial types (mostly minatures) send your wants now. I have many types like 5763, 5726, 5963, 5965, etc. mostly 5500-6200 range.

I figured this is the time of year everyone has their bench full of projects... might as well get these tubes out and into the sets they were meant to serve!

While ANY 4 or 5 element tube will work as a regen detector, in the electron coupled feeback circuit (long name for Hartley) the suppresser grid (if present) should NOT be connected to the cathode, but directly grounded. So on this basis the 6AQ5 isn't the best choice. Below 15mhz control of regeneration won't be a problem, but above that the tube choice might make a difference.
The fact that the 6AQ5 is a power tube doesn't matter, in fact I have seen 807's used as regenerative detectors!

If you can't connect the suppressor element directly to ground, the plate tickler feedback circuit is better than the hartley. Also instead of a tap on the main coil, a tickler can be placed in the cathode circuit. This makes it easier to adjust the number of feedback turns. In either case cathode feedback saves a pin on the plug in coils.

Source record: 14037
Cross-posted to: rec.radio.swap,rec.radio.amateur.boatanchors

I posted these a few weeks ago, and some found
a home, but I still have too many tubes that I can't
really use - so I cut the prices further. Here's an
updated price list:

Qty. Type Web Price My Price ea.

1 2K25 $25.00 $9.50

1 3E29 (829A) $14.00 $7.00

1 5D21 $42.00 $18.00

1 705A $10.00 $5.00

3 815 $15.00 $7.00

1 826 $35.00 $12.00

2 829B $14.00 $7.00

2 832A $7.00 $3.50

1 8122 (used?) $225.00 $71.00

1 7034/4X150A $90.00 $38.00
(new in box Eimac)

(3) 4-125A/4D21 $95.00 ea. $44.00 ea.
(2 Eimac, 1 GE)

I can't test most of these, but I guarantee no DOA
tubes or I'll refund the purchase price.

Don't like the price? Make me a reasonable offer!

Drop me a note if you can use any of these, thanks.

It was a lazy Sunday around here so I got to spend some time
in the display room putting the finishing touches on the
model 87 transmitter. I just updated the web page with photos,

http://radioheaven.homestead.com/CB87.html

Many thanks to all that helped with this project.

I'm really proud of how it turned out.
Let me know what you think.

Several of us are going to do an antique radio display at the upcoming
Charlotte Ham Fest, you might get to see it there, and
at the Charlotte Conference in March.

It feels really good to have this project done,
now I can clean up the display room again.

73, Ron

Thank you guys for the replies. The origonal plate choke is still in place and has decent DC resistance. I have removed the solder bridges with some solder wick, checked the 47 ohm reistor and it is OK. Also reserch in the ARRL 200 and 2006 books explains the use of this choke, its different configurations and how to test an amp for indication s of parasitic oscillations.

Thanks for ths clues on how to resolve this problem. Your direction helped. I will report back later and let you know how the initial restoration alignment and burn in goes.

Paul.

Source record: 13897

FS: REAL NICE HAMMARLUND HQ180

Great cosmetic and electrical shape, just realigned. I am presently using this receiver on on 75/160M AM. Plays great, looks great. Has been retubed, old/defective components replaced, and cleaned. Tested from 540 khz to 30 Mhz and it pulls in signals as well as an FT1000MP sitting next to it. Stable and calibrated. On AM it has better selectivity and audio than the MP. On sideband it sounds good and has minimal drift. Has aftermarket clock, includes manual. Looks every bit as good as the pictures (which will be emailed on request).

Price is $425.00. I prefer not to ship this, due to risk of damage by carrier. I am in the Kansas City area and will drive 100 mile radius to meet buyer. I will ship if you insist, but cost of double boxing, packing materials, and freight charges are responsibility of buyer. I do not intend to make money on the packing/shipping, just want to make sure the item arrives at your location without damage or hassles!

I also have the matching S200 speaker (sounds GREAT) in equally good cosmetic/electrical condition. Inquire if interested.

Send me your email address and I'll send photos and answer any questions.

FS: Collins 32V-3 HF Transmitter NICE!!!
This has plate modulation so when you key
120 watts on AM you get about 450 Watts or so out.
If you're looking for a clean 32V-3 this is it.
Non smoker and it works 100 Percent!!
I hardly use it. Looking for someone to pick it up locally here in
Essex County NJ
or you pay shipping UPS.
Price: 1000.00

To read up on it, Go to:
www.collinsradio.org/html/32v-3.html

Reply To:

Hi,

I'm looking for the KNOBS for Heath "Indian" series gear. You know, the Seneca, Mohawk, Apache, etc... any quantity or size, even one.

Or, I'd consider a working or non working rig or accessory gear with the knobs...

Thanks

Digressing even further...telemarketers...

One evening when Wife was out doing schooling, a telemarkerter called. I knew by the blank beginning while the computer connected the next operator.

Tele: "Is Mrs N. Home?"

Me: (somewhat grufly) "She's not here."

Tele: "Is Mr. N home?"

Me: (More Grufly) "Haven't seen him in three weeks!"

Tele: "Oh, then I'll call back at a more convenient time."

C R A C K E D me up.

How do I think of this stuff??

So far, 3/4 times I got the septic additive salesman to hang up on me... "Now, After dumping $175 of your powder down the pot, how will I know if the stuff is really working like you say...." The 4th time, I couldn't shake him...even though I finally told him I was only going on to keep him on as long as I could to keep him from bothering as many others. I had to hang up...shucks!

73, Steve, K,9.D;C'I

Years ago (Before Caller ID) I had the same heating and air
conditioning company call me over 30 times in one week. Nothing worked
with this woman. She was insistent that I just HAD to have my central
air conditioning "Tuned up", even after I told her repeatedly I didn't
have central air, or even a window air conditioner. Finally, I asked
her how many incoming phone lines they had, then I told them that if I
got one more call from them that I would contact everyone I knew to have
them call and pretend to be interested in their repair services or to
buy a new system, then give them fake addresses, or just keep the phone
lines tied up to prevent real customers from being able to reach them.
I was informed by her that it was harassment, but I just laughed and
asked how they would know which calls were real, from the others. I
asked why I should return the harassment I had received from her all

week long. She never called me again.

My understanding of AM transmitter technology would estimate that a 32v3, with ~120 DC input (two 6146s, or were they still using one 4D32?) would have at most (class C, plate modulated) 70% X 120 = 80 watts of CW carrier output. 60 watts of audio on that final tube (as a non-linear high level mixer) will at best, double the _instantaneous_ (peak) input voltage, therefore power to 240 watts (plate current will _not_ double even if the plate voltage doubles on peak audio cycle [look at your tube curves again of iP vs vP at constant biases]) which you could only attempt to measure with an oscilloscope. Peak output? Could it be more than 240 x 0.7 = 168 watts? I doubt it (unless he's got something like "super-modulation" in the rig).

Without delving into the limitations of the 32V3, according to the info
from an ARRL publication:

"..since the amplitude at the peak of the upswing is twice the unmodulated
amplitude, the power at this instant is four times the unmodulated, or 400
watts."

Average power, on the other hand, will be 1.5 times carrier. A Class C
amplifier with high level modulation should produce an instaneous PEP
of 4x carrier power.

Pete

Getting back to basics: A 120W (input) power, class C stage, will require 60W of audio (using a high-level, e.g. plate, modulator) for 100% modulation. If we assume 85% efficiency, then the output will consist of a Carrier of 102W and two sidebands of 25.5W each.

In my opinion, any other explanation is useless. Do remember that the carrier amplitude does NOT vary with modulation.

Don

I don't remember the 32v3 specs but a pair of 6146B's is rated for 120 watts carrier output on AM. 6146A's are rated for 100 watts output on AM.

Assuming the 120 watts carrier output, when modulated 100% the voltage doubles and the current also doubles on modulation peaks. Doubling the voltage and doubling the current works out to 4 times the power. This is of course Peak Envelope Power of the signal which would be 480 watts.

You can not just add the audio power to the carrier power to find PEP. You must first add the voltages together.

Peak envelope power is what the FCC is concerned with for maximum allowable power of 1500 watts.

Although when advertising an AM transmitter it is common to state the carrier power and not try to confuse people by stating the PEP power and not stating that is what is being speced.

Where does the double voltage come from at 100% modulation? I can only
account for a 50% rise in voltage.

My point is that listing the PEP capability of an AM transmitter isn't as
useful as stating it can output about 100 watts.

Don

Does anyone have a service manual or schematic for the GenRad 1390-B noise generator? Mine produces noise which seems very centered on 60 Hz unfortunately, and it's not the B+ filtration. Documentation would be a big help.

I agree stating PEP output of an AM transmitter does little. But a properly operating transmitter should be able to give pep at 4 times the carrier power. Some transmitters do not have that capability because of a poor modulator or too small finals, or power supply etc. I, like Peter, was trying to dispel the somewhat misleading add of the original poster.

As far as the voltage doubling with modulation, you only need to look at the output on an oscilloscope at the composite signal and you will easily see that it does. Set the scope to show the carrier level at say 2 divisions on the screen. With modulation you will see the positive peaks reach 4 divisions on the scope. The negative peaks will reach zero on the scope.

Another way to look at this is when modulating the final the peak audio voltage must equal the plate voltage for 100% modulation. In order for the modulation to go to negative 100% the audio voltage must cause the plate voltage to swing down to zero. By the same note in order to reach 100% positive modulation the audio voltage must cause the plate voltage to go to twice the dc voltage.

It may seem confusing because if you add the average output power up a 100 watt transmitter is only 150 watts. 100 watts carrier and 25 watts in each side band. However if you add the voltage of the carrier plus the voltage of each audio side band and then calculate the power you will see that it is 4 times the carrier power.

100 watts into 50 ohms = 70.7 volts
25 watts into 50 ohms = 35.35 volts
25 watts into 50 ohms = 35.35 volts
Total voltage = 141.4 volts (which is 2 x carrier voltage)

P= E squared / R

141.4 x 141.4 = 19994
19994 / 40 = 400 watts

I think Gary Schafer's analysis (below) is basically correct but I have minor comments to add (in addition to my earlier post, also quoted below, claiming the 400+ peak output just could not be possible, but I think I was wrong about that). See below.

I also think it doesn't mean much even for an SSB signal (which is
difficult to compare with AM coming from the same station) because the
S-meter damping makes it difficult to measure signal strength. Also, for
the power in two sidebands (only one of which is needed) and the waste in
the carrier, the usual efficiency of a linear amp is about half of that
for a (non-linear) AM final amp.

But a
> properly operating transmitter should be able to give pep at 4 times
> the carrier power.

I think this contradicts something you said below, and contradicts what I
said in my post, above. See more below.

Some transmitters do not have that capability
> because of a poor modulator or too small finals, or power supply etc.
> I, like Peter, was trying to dispel the somewhat misleading add of the

> easily see that it does. Set the scope to show the carrier level at
> say 2 divisions on the screen. With modulation you will see the
> positive peaks reach 4 divisions on the scope. The negative peaks will
> reach zero on the scope.

Yes, and I have done this, myself and seen a carrier "band" on my scope,
and when speaking into the microphone (on a Johnson Ranger), seen the high
peaks go up to about double the height of the carrier and the valleys go
down to about zero (below zero would take the carrier away thus leading
to splatter).

> Another way to look at this is when modulating the final the peak
> audio voltage must equal the plate voltage for 100% modulation. In
> order for the modulation to go to negative 100% the audio voltage must
> cause the plate voltage to swing down to zero. By the same note in
> order to reach 100% positive modulation the audio voltage must cause
> the plate voltage to go to twice the dc voltage.

Yes, but none of this explains where the "4X pep" statement comes from. In
fact, even at the instantaneous double the plate voltage, there is no
plate current increase. The (non-linear) tube is not a (linear) resistor

where you double the voltage accross the resistor and cause the current
to double, thus a quadrupling of power. Look at the curves in your tube
manuals for any given control (triodes if no other grids are present) or
screen grid (tetrodes or pentodes) bias. Above some threshold plate voltage
the plate current is independent of plate voltage. Plate current is only
affected by grid voltages.

> It may seem confusing because if you add the average output power up a
> 100 watt transmitter is only 150 watts. 100 watts carrier and 25 watts
> in each side band.

I think this is right.

However if you add the voltage of the carrier plus
> the voltage of each audio side band and then calculate the power you
> will see that it is 4 times the carrier power.

I don't think this is quite right and, after thinking about all of this,
part of the reason I already gave above is also not quite right.
Here is another way I think we can look at this question (see below):

> 100 watts into 50 ohms = 70.7 volts
> 25 watts into 50 ohms = 35.35 volts
> 25 watts into 50 ohms = 35.35 volts
> Total voltage = 141.4 volts (which is 2 x carrier
> voltage)

I think this is a bit of a mistake and it would be better to calculate
peak power in the following manner:

First, there is no peak output power from the carrier, the carrier is
always there and at the same strength no matter if there is modulation or
not.

So, power contribution FROM THE CARRIER (whether modulated or not) is
still only your 100 watts, period. The carrier contributes NO extra power
to the peak power we're all interested in.

Now, lets look at the power in the sidebands. I'll accept that 25 watts as
converting to 35 volts, but that 35 volts is not added to carrier
power because it is in the 2-3 kc spectrum above or below the carrier.
So, use your formula below and get (35 X 35)/50 = 1225/50 = 24 watts.
And, for the second (other) sideband, there will be another 24 watts.
Total: 48 watts of audio translated to RF in addition to the 100 watt
(constant) carrier. Thus peak power is 148 watts.

Where is the conflict between my analysis and yours?

Its in the way we think about modulator power output (usually stated as
audio power must be about half of final DC input, thus a 120 w DC input
class-C final needs about 60 watts of audio). So, when you look up, for
example the specs on a pair of 6146s in modulator service (go look in the
back of your ARRL handbooks, any of them) and see them talk about 110-130
watts for the pair in either AB1 or AB2! They don't tell you that is _peak_

audio power! For the same tube in class C, they are showing 50-70 watts (continuous RF) out for one tube. Not much difference in power specs per tube, but you won't get anywhere near those 110-130 watts of audio in continuous (i.e. average) power because the heat dissipation will melt the plates since class AB is much less efficient than class C.

So, your example of 25 watts per sideband is more like an _average_ power specification and what we should be looking at is what is the peak audio power (or voltage) coming out of the modulator. That peak audio voltage out of the modulator has to be equal to the plate voltage and in the same direction to double the final amp plate voltage, and valley bottom audio equal to the final amp plate voltage but in the opposite direction to reduce plate voltage to zero or near zero. Final B+ voltage plus the audio peak thus shows up on the scope, transiently, as RF output voltage at double the height of carrier alone, and final B+ minus the negative audio peak, at the negative peak, causes the height of the scope trace to go, transiently, to zero. So, when THEY talk about 60 watts of audio power to modulate a 120 w DC input final amplifier, they are talking about more like 60 watts average power which really means something like 120 watts of peak power (and is in all of the tube manuals where specs for all of the amplifier classes are shown next to each other! [this is not the case for receiving tube manuals which talk about average signal output for tubes like 6L6s in classes A and maybe AB]). This gets us into the audiophiles' endless arguing about what audio power means and under what conditions and specifications (eg. the distortions) need to be made for considering peak audio power, especially in music audio (with eg. drum beat transients) rather than voice audio (more or less steady).

My general feeling is that in the AM transmitter situation (and the SSB situation, too) that talking about peak power has only theoretical value and almost no practical value and is confusing. You can only measure it on a scope and S-meter readings will be subject to the damping factor in the mechanical needle, electronic fudging by so-called "peak reading" meters including the bar graph things, and any asymmetry in the voice waveform, and distortions and non-linear characteristics in the rest of the electronics. I have heard guys on the air using the same amplifier in a linear class mode who switch from AM mode to SSB mode and my S meters (on lots of receivers) show the same peak value on SSB as the steady value on AM, plus or minus maybe one or two db, at most.

Guys would be best off talking about final amp measured DC input watts (continous) and/or final amp measured carrier (continuous) RF output watts and not say too much about their modulator power unless they have a scope on the instantaneous modulator output voltage and current and can actually make a real, valid, representative measurement of both peak and average power and be able to say "Oh, my actual, real, measured-on-a-scope instantaneous peak whatever is X plus or minus Z accuracy."

Now, how about peak power input to your 100 watt incandescent light bulb at home? Remember your house AC line voltage (117 VAC) is measured and speced as RMS (root mean square), so peak voltage is 1.41 X 117, peak

current is 1.41 x 1 amp, and peak power is thus 1.41 X 1.41 X 100 watts?
About 200 watts? Is that meaningful? No, because it isn't. Think DC and
why RMS specs are always used for AC circuits and VOM voltmeter scales.

Thanks for your attention, sorry to be long-winded.

Art, W4PON

Let's review some definitions to start:

AVERAGE POWER

Average power is found by squaring RMS voltage and dividing by
resistance. Or RMS voltage times RMS current.

PEP

It helps to fully understand exactly what PEP is in an SSB
transmitter. Then it is easier to see in an AM transmitter.

Peak envelope power is important because that is how the FCC defines
how much power we can run.

Let's look at the FCC definition of Peak Envelope Power:

"Peak envelope power output of a transmitter is the AVERAGE power at
the crest of the modulation envelope over at least one rf cycle."

NOT TO BE CONFUSED WITH AVERAGE POWER READ ON A METER as it swings
around!

If you think about what that is saying it will make sense. If you
transmit just a carrier with an SSB transmitter of say 100 watts. That
is 100 watts average power output. It is also 100 watts PEP output.
(in this case the envelope is infinitly long) If you were to key it on
and off in the CW mode the power relationship would be the same. 100
watts PEP on each CW dash or dot sent.

If you now switch to the SSB mode and modulate the transmitter so that
the peaks on the scope looking at that signal reach the same height,
the transmitter will be putting out 100 watts PEP.

If you were to modulate that same SSB transmitter with 2 equal
amplitude tones you would get a scope pattern that looks similar to an
AM signal modulated with a single tone. The crest (or peak) of the
waveform represents 100 watts PEP same as with voice but with the
tones it is easier to see as the waveform will be stable.

If you were to increase the speed of the time base on the scope and
spread the waveform out you would see that each crest of the audio
wave form has within it many cycles of the RF frequency. These many
cycles of RF are the AVERAGE power contained in the signal.

You will note that the maximum AVERAGE power is only reached for
several RF cycles at the crest of each audio cycle.

This is what is known as PEAK ENVELOPE POWER. (see definition above again)

PEP WATTMETERS

A true PEP reading watt meter will show the peak envelope power of the above signals as described.
There are a lot of so called PEP watt meters on the market. Not all are able to properly read. Even the Bird meters have problems with some types of wave forms.

S METER READINGS

S meter readings will vary according the particular receiver being used but most all S meters are peak responding circuits. Most will read pretty close to the peak values, depending on the decay time of the circuit some may not hang up there like others do. If you think about it if you have ever been plagued with pulse noise like ignition noise it only takes a very narrow pulse occurring at a rather slow rate to hold the S meter up high. Increasing the rate will not increase the meter reading.

Likewise with an SSB signal, once the station is transmitting his peak power on a regular basis, increasing mike gain or increasing compression will not raise the S meter reading maximum.

The AVC circuit in the receiver must respond to the peaks or the receiver would overload the detector if the gain was not cut back when a peak was received. The S meter reads AVC voltage.

AM TRANSMITTER

It is best to try and understand the output signal of the AM transmitter before trying to coralate it with what goes on at the input side. Swapping back and forth can be confusing.

Take our 100 watt carrier output transmitter again. Measuring the output voltage of the RF we find that it is 70.7 volts RMS across our 50 ohm load. P = I squared / R so 70.7 x 70.7 = 5000. 5000/50 = 100 watts.

Let's modulate 100% with a single audio tone. We get out of it a 100 watt carrier and two 25 watt side bands. 3 distinct signals. As you stated before the carrier always remains constant.

If we look at the output signal on our scope we will see that it looks similar to the SSB signal that was modulated with 2 tones. We see the modulation envelope. We can again expand the scope's time base and look at the RF cycles within each modulation peak. Same as with the SSB signal, at the crest of the modulation envelope is the peak envelope power of the composite signal.

Now let's get back to measuring that PEP. We know that the carrier alone had a power of 100 watts which produced 70.7 volts across a 50 ohm load. If we look at the scope with and without modulation we see

that the voltage output doubles with modulation so it will be 141.4 volts RMS at the crest of the modulation wave form.
Again P = E squared /R. 141.4 x 141.4 = 20000. 20000 / 50 = 400 watts PEP.

If we were to measure this with a good PEP wattmeter we would see the meter also indicate 400 watts PEP.
Again some so called PEP meters do not do well on this type of wave form. The carrier tends to confuse the meter as it causes an offset in the voltage being read by the meter and the meter tries to average it so the net result is some gets subtracted from the reading. It is due to the way in which the particular meter circuit operates.

CONVERTING RMS TO PEAK

It would seem at first glance that you could find the peak power of the 25 watt side bands and add things together but that doesn't work. You can not convert power. THERE IS NO RMS IN POWER!

There is a wide misconception that there is something called RMS power. There is no such thing! There is only AVERAGE power and PEAK power. (note the FCC definition of PEP)

You find average power by using RMS voltage. But once you multiply or divide, RMS term, the RMS goes away.
So once you have power you can not multiply it by 1.414 to find peak power.

To find peak power you must first add the voltages together or find the peak voltage of an rms voltage by multiplying by 1.414 then finding power.

AM LINEAR

Operating an SSB transmitter and amplifier in the AM mode, if properly set up, will produce exactly the same looking output signal as a plate modulated AM transmitter.

If we have an SSB amplifier that will put out 1000 watts PEP on SSB it will also put out 1000 watts PEP on AM.
But in order to do so the carrier output must be limited to 250 watts output. It must be tuned up in the CW mode for 1000 watts output. Then when switching to AM the carrier is reduced to 250 watts output without touching any tuning controls. The amplifier must still be tuned to be able to produce the 1000 watt peak envelope output.

When we modulate the 250 watt carrier with AM the peak envelope power at 100% modulation will reach 1000 watts pep (or 4 times the carrier) just as it did with the plate modulated AM transmitter. Looking at the output with a scope we will see the voltage double with modulation verses just the carrier.

POWER IN SIDE BANDS

As a note is seems that having 2 side bands with the same information in an AM signal is useless but it is not.
In the detector of the receiver the energy in both side bands combine and add together. So rather than using only 1 side band of 25 watts you are really using 50 watts of side band energy. So a 3 db addition. There is also another 3 db gained in the detector because of the voltage doubling with the side bands being coherent in the detector. So the carrier is really the only thing wasted.

PLATE CURRENT AND VOLTAGE DOUBLING

It is easiest to see with a triode tube that is plate modulated. Doubling the plate voltage will cause the plate current to also double. That is if the tube is capable of providing enough emission. This must be a linear function in order to avoid distortion when modulating.

Tubes that are weak may not be able to provide this. That is one reason that PEP may not fully reach 4 times the carrier power with 100% modulation.

Screen grid tubes are not linear in this respect. Plate current is somewhat independent of plate voltage. That is why you must also partly modulate the screen along with the plate when using a screen grid tube in the final. You want to have a linear plate voltage to plate current relationship.

This is also why a lot of broadcast transmitters use triodes in the final. Easier to maintain linear modulation.

HANDBOOK

All this can be found in the AM section in some of the older handbooks. The newer ones do not cover AM very well.

Hi,

I've had good luck with the edebris site using FTP directly:
ftp://216.24.174.245

Just remember not to try to download more than one document
at a time, or you'll get the "Too Many Connections (1)"
warning. The downloads are slow, but at least they happen.

Ah yes mr exray, a little lubrication couldn't hurt. Thanks for reminding me. I have used the site over past three years or so and maybe download a dozen manuals without ever thinking that some working stiff is probably footing the bill. I'll make sure to send a few bucks and let em know how much site is appreciated. I have absolutely no prob with paying a few bucks for a manual and am probably into them (manual hawkers) for a hundred bucks for the manuals I couldn't find on Bama.

And yes Mr 3, too many people. Nothing a good neutron bomb wouldn't take care of though - Relief is just a pushbutton away :-)

Mr Terrell,

I am an old Tin Can Sailor Outta Pearl and have a DD214 as well. Thanks for your service, and prey for our young children in the military, and for those we have lost and for their survivors.

And lastly mr Knobloch I will try FTP. Thanks for the suggestion. I think I may need an ftp client. No? Last time I used cute ftp, but that was many years ago.

regards,
Bob

I see you are using Mozilla. Type in the ftp address as a URL and it
may do the trick just fine.

GL,
Bill

Gary (and anyone else who cares), since my last post, which responded to several other posts on the topic of PEP in an AM transmitter, I looked up some things and cleared up a major misunderstanding in my own mind. I will add that as comments to the part of your post, below, which is relevant to the issue. As far as all of your definitions below, PEP wattmeters, S-metes, SSB signals are concerned, I think you made a lot more mistakes than you realize. However, I'm going to delete all these irrelevant parts (most of what you said) and concentrate on the source of the confusion. I may make comments in a separate post on the parts I deleted fro this one.

> PLATE CURRENT AND VOLTAGE DOUBLING

Here is the crux of the problem. Earlier today I looked in my old RCA receiving tube manual and transmitting tube manuals at the transfer characteristics of many dozens of tubes and I looked at them with this question of PEP for an AM signal. I will incorporate some of what I learned as comments on your comments. The basic fact that I was not aware of is that there is an apparent conflict between the relationship between plate current and plate voltage if you look at the curves that show plate current as independent of plate voltage and then ask how do you get, on modulation, a peak input power four times the unmodulated input power so you can get a peak, on modulation, output power that is four times the unmodulated output power.

> It is easiest to see with a triode tube that is plate modulated.

Nah, "easiest" has nothing to do with it. Triode has nothing to do with it.

The issue is that all of the triode transfer characteristics curves I saw showed plate current to be _proportional_ to plate current (but with offsets and some non-linearities, which are mostly unimportant).
When I looked at all the tetrodes and pentode curves, then, yes, they all showed plate current independent of plate voltage. However, at any given plate voltage, plate current was also _proportional_ to screen voltage (also with and offset and some non-linearities). Now, it makes sense that if screen voltage is made proportional -- in some fashion (usually a screen voltage dropping resistor connected to the modulated plate supply)-- to plate voltage, then plate current will increase, or decrease, in parallel with plate voltage as modulator voltage adds, and subtracts, from the B+ plate voltage (all as the modulator output signal varies with audio input waveform)

> Doubling the plate voltage will cause the plate current to also
> double.

From the curves, the relationship between plate current and plate current might not always be exactly a 1:1 relationship, but to an approximation this doubling is an acceptable understanding. And, that is how, on peak input from modulation one gets four times unmodulated input, and output will be proportional to input which can be looked at as average or peak,

but the peak output on modulation will also be four times unmodulated output.

> That is if the tube is capable of providing enough emission.

That is a separate issue and anyone designing a circuit and sellecting a tube for use needs to understand the specifications in the manuals.

> This must be a linear function in order to avoid distortion when
> modulating.

Almost nothing is perfectly linear. All audio circuits will have measureable distortion (IM, harmonic, and others). The only criterion is whether the distortion is acceptable.

> Tubes that are weak may not be able to provide this. That is one
> reason that PEP may not fully reach 4 times the carrier power with
> 100% modulation.

I think for this issue one needs at least an oscilloscope to even start measuring and investigating what is going on (and they need to be wideband or sampling scopes, too). "Meters" are just indicators.

> Screen grid tubes are not linear in this respect. Plate current is
> somewhat independent of plate voltage. That is why you must also
> partly modulate the screen along with the plate when using a screen
> grid tube in the final.

There is an equally important reason why you must, and preferably, fully modulate the screen voltage as well as the plate voltage (and this is almost never discussed). If you ever have screen voltage above plate voltage, then screen current will go up dramatically and so will screen heat dissipation. You could melt the screen grid with just one word into the microphone. You can blow the screen grid almost instantly just by accidentally having screen voltage present without plate voltage.

You want to have a linear plate voltage to
> plate current relationship.
>
> This is also why a lot of broadcast transmitters use triodes in the
> final. Easier to maintain linear modulation.

I think, if you looked at as many transfer characteristics, as I did earlier today, for transmitting tubes, you might appreciate that there is more heterogeneity between triodes than tetrodes or pentodes in terms of plate I/V relationships. Broadcast AM transmitters never gave us any kind of high fidelity so linearity was never that much of an issue. In broadcasst FM transmitters, power and voltage linearity anywhere in the RF chain was irrelevant.

>

Since my earlier post (dealing with the question of what is peak evelope power output in an AM transmitter), I've been doing more scrutinizing of tube Ip/Vp characteristic curves. They are much more non-linear than the impression you get from just looking at the curves. Also, it is rare or almost non-existant to find Ip vs screen voltage!

Lets look at the venerable 833 (from my RCA TT-3 transmitting tube manual). This is a KW input class C triode.

From the curve:
at zero grid volts, 1 kV on the plate gives 175 ma plate current
2 kV 500 ma
That's more than a doubling of Ip for a doubling of Vp

at minus 50 grid volts, 2 kV on the plate gives 50 ma plate current
4 kV 750 ma

looking in my RCA receiving tube manual (RC-20) I found for a 6FG6 a sharp cutoff tetrode that only at zero grid volts was there a near linear relationship between plate current and plate voltage (meaning zero current at zero voltage, and a straight line [which actually deviated slightly from a straight line] with some slope. But at 100 v on plate, current was 14 milliamps, at 200 v on the plate, plate current was 34 miliamps. Definitely NOT a linear relationship. For the 6EM7 a triode, and at any of a wide range of grid voltages, plate current could be doubled with only a 15-20% increase in plate voltage.

My thinking on all of this leads me to claim that anyone who can start with a 100 watt carrier from an AM transmitter and make a few assumptions about 100% modulation and come up with a _calculation_ of something like 400 watts of peak power and represent that as having something to do with reality is pure conjecture.

If anyone wants to put an appropriate oscilloscope on the transmitter output and measure the RF voltage of unmodulated carrier into an appropriate load and then measure the peak RF voltage when the carrier is modulated, then and only then do they have a reasonable _basis_ for making a claim about peak (instantaneous) output power.

As I first explained, there is a direct relationship in a triode
between plate voltage and plate current. That is why I said "it is
easiest to see when looking at a triode".

A tetrode does not have that same direct relationship so it gets a
little more complicated to modulate a tetrode.

Operating almost as a triode as far as modulation goes.

Glad you understand.

I assume that when you say "plate current and plate current" that you
mean to say plate voltage and plate current.

The PEAK ENVELOPE POWER output will be 4 times the unmodulated output.
Re-read the deffinition of PEP which you deleted.

One tries to operate the tubes in the most linear portion of the
curve. The non 1:1 relationship is called distortion.

>
>> That is if the tube is capable of providing enough emission.
>
>That is a separate issue and anyone designing a circuit and sellecting a

It is not a seperate issue. It is an all important issue whether
operating or designing. The cause of not enough emission can be from
several causes. Too low fillimant voltage, improper screen voltage,
final loaded too heavy, not enough grid drive, weak tube, etc. Any of
these can be the cause for low PEP compared to carrier power.

"Must be a linear function" denotes as near linear as practicable. Of
course nothing is perfectly linear.

Yes indeed a scope is a must to properly set up an AM transmitter. It
also helps to understand what is happening. The reason I suggested
"looking at the wave form on a scope".

You do not need a wide band scope. Only one that will cover the RF
frequency that you are operating on.

It is not that great a problem. Audio has a very low dity cycle. If
the screen is fed with a resistor the screen current will be somewhat
self limiting. There are many transmitters that get abused in this
manor. However it is best to control it properly.

>kind of high fidelity so linearity was never that much of an issue.

As you learn more about AM transmitters you may change your mind on
this point. Modulating the screen is not as linear as simply
modulating the plate of a triode.

Simply modulating the screen along with the plate works well for some
type screen grid tubes but not others. Sometimes the amount of
modulation to the screen must be limited. You can overmodulate the
screen and have it cut off well before the plate voltage swings to the
cutoff point. It will have the same splatter effect as overmodulating
the plate. Other tubes need more audio applied to the screen to
modulate properly.
Distortion is usually highr when modulating a screen grid tube than
when modulating a triode.

You can't just look at static curves. Consider that with AM modulation
there is usually grid leak bias on the final tube being modulated.
This allows the grid voltage to somewhat follow the modulation and

helps smooth out the non-linearity in the plate.

If you have access to any of Termans books, as peter said, there is an excellent section on how modulation works.
He in fact shows that "plate current follows plate voltage almost exactly with modulation". His words.

He also says that "triodes have considerably less distortion than screen grid tubes".

Thank you for your time in the service as well, Bob. The sig is being used because of a few derogatory comments made to me online about US Veterans, and my work with local Veterans. I am 100% disabled veteran, but I volunteer my time for the local Vets helping Vets" program, as well as help provide working computers to local disabled and disadvantaged Veterans in Marion County. My latest information is that there are over 48,000 Veterans in Marion County and a lot are either senior citizens, or disabled, so much so that the VA recently opened a second outpatient clinic in Marion County, and is expanding the VA hospital in Gainsville due to the heavy workload. Also, due to the warm climate and the large protected areas of the Ocala national Forest there were a little over 2000 homeless veterans living among the trees in makeshift camps about a year ago. Its had to help most of them because they were told "NO" so many times in the past that they don't trust people who do offer to help. We are working an another round of having volunteer doctors and dentists visit the more populated areas in mid April to try once again to help some of them back into society. We already try to provide them with food and clothing, but most won't leave their camp for fear of it being raided or torn down while they are gone. Its a very sad place to visit.

BTW, I hope you meant to say "Pray", not "Prey" Lousy spell checkers! ;-)

Methinks you are way too hung up on the abtract theory of how linear
tubes are.

In practice the majority of AM transmitters rated at 100 watts of carrier output are indeed putting out 400 watts PEP with 100% modulation. As another poster pointed out, this is easily proved by using an oscilloscope or with SOME Peak reading wattmeters.

The FCC certainly agrees with the 4:1 ratio. That's why when the Amateur power levels permitted by the FCC in the USA were raised to 1500 watts output PEP, the net result was that users of A.M had to REDUCE carrier power to approximately 375 watts output.

Many diehard AM'ers and even the ARRL vigorously protested this net reduction of power for AM use.
As I remember the FCC grandfathered the old power limit of 1000 watts DC input to the final amplifier for Am'ers but only did so for a couple of years.

Back in the good old days, I used to run a Technical Materiel Corp GPT-750 AM transmitter on 3885KHZ. I ran 1KW DC input on the plate with 100% modualtion. That required a 500 watt modulator in the transmitter. The pair of 4-400A's in the rig easily achieved a power output of 800 watts under class C high level modulation.
Thus I was legally running 3200 watts PEP output power.
The power supply exceeded 3000 volts and was rated at 1.5 amps CCS, easily achieving the peak power demands..

You are sort of beating a dead horse. this was extensively discussed everywhere in Amateur circles about a decade ago.

got some stuff closing on eBay tonight, here's one for some 2E26
tubes....take a look and click on my other auctions... if these dont sell
tonight I will you a deal if you need anything, otherwise I repost them and
then after that they get donated to the Michigan Antique Radio Club
"Donation Auction" at the FEB 4 swap in Farmington Hills, MI.

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=5856524630&rd=1&sspagename=STRK%3AMESE%
3AIT&rd=1

email any other tube wants, I have both industrials and antique radio types.

Yes, and all of the threads, including my own reflection and further
study, helped me develope a better understanding of an issue that never
had been presented to me by others in a complete manner. This includes the
apparent conflict between Ip/Vp curves which in all tetrodes and pentodes
or nearly all that I've seen that show Ip independent of Vp over a range
that would normally be used under real conditions in AM.

I have more comments, below.

You (and others) talked about a doubling of plate current with a doubling
of plate voltage and gave no basis for this statement.

That is why I said "it is
> easiest to see when looking at a triode".

And, I stand by my comment below.

> A tetrode does not have that same direct relationship so it gets a
> little more complicated to modulate a tetrode.

And, you can use the same phrase -- "direct relationship"-- for triodes
vs tetrodes and above. It is just that the "direct relationship" will be
different and anyone who compares the characteristics of two or more tubes
will see that.

"almost" is another one of your mistakes because, "as far as modulation is
goes," you will definitely need to modulate the screen grid which is in
tetrodes and above but is irrelevant for a triode which has no screen
grid.

> Glad you understand.

Yeah, I read it. Some of us have heard the rumor that the FCC has lawyers write its material, not engineers. I wasn't too impressed with that definition, by the way.

> One tries to operate the tubes in the most linear portion of the
> curve. The non 1:1 relationship is called distortion.

I would make a distinction between non-linearity and distortion. I can think of situations where non-linearity is part of a characteristic of a device or circuit but distortion (a word which is a specification on an output signal which is less than perfect) is irrelevant.

>>

It should be possible to assume that the tube has the correct fil voltage on it.

> improper screen voltage,

Why would anyone build a circuit and not understand the need for the proper screen voltage?

> final loaded too heavy,

Any time one sees output power go down with more loading, they should know better.

> not enough grid drive,

In a class-C amplifier with self-generated control grid drive, the plate current has always gone up in my tubes (sometimes this is mentioned in the manuals and handbooks). Or, the clamp tube limits the plate current (eg. Johnson Rangers) or fixed bias from a separate control grid bias supply limits plate current (I've had this, too, in my homebrew creations) or a cathode resistor (and I've done this, too, in one of my homebrew rigs).

weak tube, etc. Any of
> these can be the cause for low PEP compared to carrier power.

All of the above are _abnormal_ situations or conditions. They are
otherwise irrelevant to the fundamental question of the relationship
between Ip and Vp and determining peak input power.

And, acceptable can range from specifications of 5-10% audio harmonic
distortion given in equipment reviews for some older rigs compared to some
of the most recent rigs which are much much lower (mostly for purists,
not me)

I agree.

> You do not need a wide band scope. Only one that will cover the RF
> frequency that you are operating on.

I have actually used both "narrow band" (DC to 500 kc) and "wide band" (DC
to 20 mHz) scopes to do this and the narrow band scopes can have such a
rapid decrease in sensitivity at the lowest ham bands that the only way to
get vertical deflection is to raise the RF voltage up to hundreds of volts
and you can't get that from a 50 watt rig without a RF transformer between
the rig and the scope to raise the input voltage and then you may
overheat the (usual) 1 megohm input swamping resistor in most scopes that
is across the input terminals. This is another thing people need to think
about before they just use "any old scope." The other option is to use a
diode and capacitor (with an appropriate RC time constant) to measure the
envelope of the RF coming out of the transmitter, but I consider this
kludge as a kludge to be avoided.

>
> It is not that great a problem.

You can't say this without saying under what conditions it is not a great problem. The small external anode tubes (eg. 4X150, and on up) all have, in their spec sheets, a strict warning about losing plate voltage with screen voltage present. All of those physically small tubes have much lower max grid dissipations than the old big internal anode tubes.

> Audio has a very low dity cycle. If
> the screen is fed with a resistor the screen current will be somewhat
> self limiting. There are many transmitters that get abused in this
> manor. However it is best to control it properly.

I think it unwise to present to people that this problem "is not that great" and you can't say things like "low duty cycle" when you also don't distinguish between voice typical duty cycle and a sine wave audio from a signal generator that could maybe triple the screen dissipation or more.

Self limiting the screen current (with a screen bypass) may not be enough and even then an increased screen current for a continuous current (vs. a varying current with lower average value) could also damage the screen resistor.

I would not treat this issue as lightly as you do.

>>

>
> As you learn more about AM transmitters you may change your mind on

> this point.

I am thankful that an issue that has bothered me for decades has
been considerably cleared up in the last two days. However, although
people here talked about Ip doubling with Vp, no one here explained the
descrepancy between this claim and all of the tube curves that show Ip (in
tetrodes) as independent of Vp! I had to put that one together by myself.

Modulating the screen is not as linear as simply
> modulating the plate of a triode.

From all the curves I saw of both triodes and all screen grid tubes I can
only say that you can't say one is "not as linear" as the other without
specifying the tubes to be considered AND going into technical details
that are far beyond the scope of our discussion.

> Simply modulating the screen along with the plate works well for some
> type screen grid tubes but not others. Sometimes the amount of

I would agree these are some of the details. I can think of more.

Fine, I just wanted to give an example where linearity of any kind in the
RF chain is irrelevant.

Its a mixed bag for me. And, I'm an old timer that appreciated simpler
circuitry and the situation that because of that it is easier to
understand what one is doing. All contemporary rigs are so complicated

that a high understanding of what is going on requires much more study, repairs often require sending the rig off for long periods, and if the rig is even not that old but specific chips are no longer available then sometimes it is easier and simpler to repair and maintain the even older tube rigs for which discrete devices are still available and there is enough extra space inside for kludge fixes if restoration fixes are imp.ossible. My two cents irrelevant to the original subject).

This was discussed in the RCA transmitting tube manual, but it also referenced the technical references which go into this in much more detail. However, if you want to say "you can't just look at static curves" then you also can't just say "doubling plate voltage also doubles plate current" either.

I will decline to check this but words and phrases like "almost exactly" and "considerably less" are unquantitative.

Three issues of The General Radio Experimenter, NEAR Mint

April, May & July of 1930.

Each issue is seven pages plus back cover.
They are nearly perfect with the exception of a
name and initials in pencil on 2 of the issues.
NO tears, NO folds, NO stains. ALMOST perfect.

The photos show each of the 3 covers and close ups
of the banners, plus one of the back covers is shown.

PayPal preferred.
USPS Priority Mail ONLY.

Well, I'll buy into the scope measurement.

I'll also buy into my prior incomplete understanding of Ip vs Vp relationships when the tube curves are looked at without realizing that screens have to be modulated as well as plates.

I don't like wattmeters (with mechanical needles) that claim to indicate peak watts or have peak watt scales. But, that is my prejudice.

And what do you do now? If you don't mind me taking a little more of your time. And, what about all these guys I hear on AM (160 & 75) who say they are running Johnson "Desks" at 1 kW input, and modified former AM broadcast transmitters with 833s in the final?

> You are sort of beating a dead horse. this was extensively discussed
> everywhere in Amateur circles about a decade ago.

A decade ago I was not interested in anything AM. A decade ago I had nothing that would even come close to putting out any power that would have even made me have to think about this FCC specification. Recently, out of pure nostalgia, I partly restored a very chopped up Johnson Ranger and got it back on the air, on AM, to my considerable delight. Otherwise it was too chopped up for a full restoration (to include CW). Similarly,

lots of things I was interested in a decade ago, I'm not interested in any more. And, I spend much more time at the bench now than at the microphone.

Do you even know who Terman is?
I would doubt that you do or you would not make statements like that.
As a matter of fact if you had read any of his work you would not be
making most of the statements that you are in these threads.

At first I thought that you were interested in learning but I see you
would rather argue for the sake of arguing.

Social Security is in trouble because when they figured the original
numbers, the average person lived to 65, so the government thought they
would, more or less, never really have to pay anything significant out.
That changed due to decent medical science, as most people in this
group (rraa is where I am right now) are more than aware.

Social Security has been busted for more than a couple decades, and none
of the bastards in the Senate or Congress or the Administration have had
the balls to let it just disappear. It is a dinosaur. And please note
I never mentioned a party here, since all are guilty of just covering
their asses just to get through another term.

And, at 52, I am one of the people that's going to lose evcerything that the government stole from me and gave away in this deal, so don't start ripping me for not caring.

In some cases it is a lot easier to accept what is technically correct, and
work backwards to correct erroneous conclusions.

First, a Class C amplifier is driven into grid conduction, almost to the
point of plate saturation.

High Level AM modulation is applied to the SCREEN and PLATE,
only doubling the plate voltage as in your 6F6 example to show
a non linear relationship isn't a valid argument. What is the
operating Class of the tube, and did you account for the modulating
voltage also being applied to the screen grid?

To quote Henny: "A linear relation must exist between plate voltage
and tank circuit current for good operation... In such a modulated
amplifier, the output peak will be four times the unmodulated
carrier and the continuous power output with complete modulation
is 1.5 times the power at zero modulation." Note that is only
true for a true Class C power amplifier stage, and not for
Class A or B.

I doubt that Henny or Tenny based their texts on conjecture or
misguided realities.

Pete

Well then if you don't believe anyone you should go and look it up for yourself. You will find that same deffinition in the ARRL handbook. Oh I forgot you don't believe what is in there either. Then try some of the Collins Radio SSB handbooks. Maybe Art Collins didn't know what he was talking about either? How about in the IEEE handbook.

Keep in mind when trying to understand PEP that there is no peak power involved. It is all average power.

Also when calculating side band power and carrier power that is all average power too. Forget about peak power.

Once you understand how this works then you can work from there to figure out the rest.

I have eliminated all the other stuff as you seem to be going round and round only for the sake of arguing and not for understanding.

I would encourage you to go to your local library and look at some of Terman's books or get his radio handbook from ebay etc. Also the radiotron designer's handbook is excellent.

I don't have the benefit of reading his works, I'm presuming that you
have, is that correct?

> At first I thought that you were interested in learning but I see you
> would rather argue for the sake of arguing.

Very early in my comments I brought up the issue of Ip being independend
of Vp in all of the curves (these are facts) for tetrode and pentode
transmitting tubes and receiving tubes and nobody but nobody called
attention to the possibility that this conflict with claims of plate
current doubling with plate voltage doubling could be resolved by
including changes in screen voltage proportional, in some relationship, to
changes in plate voltage. A few of your statements were a little
bit helpful but even the comments in the RCA transmitting tube manual were
weak in dealing with this issue.

What is a further issue is why the FCC decided to drop steady DC input (easily measured with a plate current meter) in favor of making PEP output measurement the new criterion by which transmitter power is to be measured. The only thing I can think of is that there were, in the far past, some AM amateurs who were running some form of ultra modulation or super modulation and putting KWs of audio on a 1 KW DC input to the final signal and the FCC didn't like that. Maybe if any of you have some background on this, you could mention it.

I'm sorry but how you can write a sentence, above, like "Keep in mind when trying to understand PEP that there is no peak power involved" when you use "PEP" and "peak power" in the same sentence and say something that sounds like "its there but it isn't there."

As I've already said in an earlier post that my problem was the conflict between characteristic curves for tetrodes and pentodes showing no change in Ip for large changes in Vp and the real need for Ip to move in proportion to Vp to get a quadrupling of input power on a modulation peak over an unmodulated carrier. This only can happen if the screen voltage is modulated along with plate--which everyone, including me, knows--but no one pointed out that practically all if not all characteristic curves give only curves for one fixed typical screen voltage.

Well, I didn't have trouble seeing that if a scope shows modulation RF
peaks that are double the unmodulated carrier, then the instantaneous
power at the peak is 4X. What I had trouble with was from the curves that
show plate current in tetrodes, pentodes independent of plate voltage.
What I did not consider is how screen voltge would affect plate current if
the screen voltage were modulated along with plate voltage. Previously, I
thought power input could only double but that would leave a deficit since
peak output voltage shows on the scope that power at the peak has to be 4X
the unmodulated power.

> First, a Class C amplifier is driven into grid conduction, almost to the

> High Level AM modulation is applied to the SCREEN and PLATE,
> only doubling the plate voltage as in your 6F6 example to show
> a non linear relationship isn't a valid argument.

Well, it was a 6FG6 (not a 6F6) and what we are trying to do is find out how power _input_ at the peak of a modulation cycle becomes 4X the power input when an unmodulated carrier is being put out. Part of the answer comes from modulating the screen, and one of the guys was talking about some modulation of the control grid through a "grid leak" resistor which was also mentioned in the RCA transmitting tube manual in the front which gives some rudimentary explanations for all of this (and was helpful for me to re-read).

What is the
> operating Class of the tube, and did you account for the modulating
> voltage also being applied to the screen grid?

Well, if you look at all of the curves showing Ip vs Vp, they usually give curves for a fairly large range in control grid voltages (but at only one screen grid, if it is present, voltage) so you can look at how Ip changes for any range in changes in control grid so you can know about what class of amplifier you are running by looking at highest control grid voltage and lowest control grid voltage you want to use and whether you get close to cutoff (where Ip goes to zero or, maybe, close to zero).

I understand this, now, and know where it comes from. Fine.

Note that is only
> true for a true Class C power amplifier stage, and not for
> Class A or B.

I can accept this, too.

> I doubt that Henny or Tenny based their texts on conjecture or
> misguided realities.

I can appreciate that in the more advanced treatises on the subject that the guys know more about what is going on. The ARRL handbooks gloss over a lot of this and I always wondered why the FCC changed the rule from measuring simple DC power input (plate volts X plate current), even on a linear for SSB, with a simple D'arsonval movement meter (or a digital bar graph meter that could be made to mimic a mechanical meter), to the rule that PEP output not exceed 1500 Watts. One would have to surely use a scope and I'd prefer not to have to trust these so-called PEP reading meters that are all over the place now.

But, thanks for your contribution.

His writings are very easy to understand compared to many engineering
books. He leans less on the math and more on practical explanations.
He was one of the most highly thought of professors in the radio
field. Although his books were written in the 30's and 40's, they do
not include some of today's newer discoveries, they are very well
written to explain circuit theory and things like modulation.

That is exactly what I told you in my very first post to you. That was
the one that had several different topic headings. The one that you
deleted most of the headings as "incorrect information".

This was under AM TRANSMITTERS.
"Screen grid tubes are not linear in this respect. Plate current is
somewhat independent of plate voltage. That is why you must also
partly modulate the screen along with the plate when using a screen
grid tube in the final. You want to have a linear plate voltage to
plate current relationship."

That could have been part of it. It is difficult to tell exactly how
much power is really going out with different types of modulation.

Probably the biggest reason for the change was SSB. Watching the plate
meter kicking up and down was not a very accurate means of measuring
power but in the old day's access to a PEP watt meter was almost non
existent.

Now with a PEP wattmeter it is much easier to read power output than
it is input power.

Another part of the change was to reduce the maximum power that hams
were able to use. As discussed the 1 kw input AM transmitter could
easily have in excess of 3000 watts PEP output and lots more with some
modulation schemes as you refer to.

SSB also could have well in excess of 3000 watts PEP output as well. The old means of measuring SSB power was the plate current meter on the final not kicking over the 1 kw DC input level. The meter had to have a time constant of less than .025 seconds. No sluggish meters allowed. But the average power in speech is only around 10 to 20% and that is what was measured.

Let me explain: There is peak envelope power and there is peak power.
Peak power is seldom used. Peak power is the instantaneous power at
the very peak of the voltage and current. You will see peak currents
discussed in tube manuals often.

Our 100 watt carrier output transmitter with no modulation is 100 watts average power as we talked about before. The actual peak power is 200 watts output. (nothing to do with modulation right now) This is found by multiplying the 70.7 volts RMS output voltage by 1.414 to find peak voltage. That gives us 100 volts peak. Divide that by 50 ohms and we have 200 watts peak output power. Note that peak power is 2x average power with a sin wave.

PEP
Peak envelope power does NOT involve peak power as above. It only deals with AVERAGE power.
Remember the definition of PEP: The AVERAGE power out at the crest of the modulation waveform.
(perhaps the "peak" in peak envelope power is a misnomer)

The modulation voltages, that we use to calculate PEP, in each side band are also RMS voltages, they are not peak voltages.
In the figures below are typical voltages present in the signals at the output of an AM transmitter modulated 100%. I gave these same figures in another post.

100 watts into 50 ohms = 70.7 volts (carrier)
25 watts into 50 ohms = 35.35 volts (side band)
25 watts into 50 ohms = 35.35 volts (side band)
Total voltage = 141.4 volts (which is 2 x carrier voltage)

141.4 x 141.4 = 20000 / 50 = 400 watts PEP. This takes care of our PEP power.

The amount of voltage that you see on a scope when looking at this same modulated signal, if we actually measure them with the scope, will be peak to peak voltage as that is what the scope sees.

So measuring the composite signal voltage on the scope it will show 400 volts peak to peak. Take ï¿½ that to find peak voltage and you have 200 volts peak. To find RMS voltage multiply that by .707 and that will give you 141.4 RMS volts. This is what is used to calculate PEP.

The harder the modulated tube is driven into class-C conditions and
saturation, the more linear does the plate modulation become.

Operation of the tube becomes independent of curvature in the tube's
characteristic. The plate current operating angle is small.
It behaves more like an on/off switch.

The more non-linear it is, the smaller the operating angle, the more
linear is the modulation.

=====================================

PLATE MODULATION.
It's really all very simple.

Imagine a class-C triode amplifier with very small operating angle and
running nearly into saturation.

The plate load is a tuned tank circuit having a high impedance at
resonance. Or it can be a Pi-tank circuit. Makes no difference!

With the high impedance load, conditions are such that whatever is the
DC plate voltage, the RF plate volts swing down to a very low
plate-to-cathode voltage.

Ideally it should be zero volts. But in practice it cannot fall below
the positive, peak, instantaneous, RF grid volts. This corresponds to
the instant of peak plate current.

The RF voltage across the tank is then very nearly EQUAL to the DC
plate voltage regardless of the tubes characteristic curves. Curvature
doesn't matter. It is obscured by the small operating angle. The tube
is conducting only for a small fraction of the time.

Modulate the DC plate voltage at an audio frequency. With 100 percent
modulation the DC plate voltage swings between a very low voltage and
twice the DC supply volts. And so do the RF volts across the tank.
The job is done. You have an almost perfect linearly modulated
amplifier.

It is necessary only to ensure grid drive is just sufficient to drive
the tube into saturation when the DC plate volts is twice the DC
supply volts. It will then remain saturated at all lower voltages.

With a triode, saturation occurs when the RF plate voltage swings down
to not much more than the peak RF grid volts.

With a beam tetrode, saturation occurs when the RF plate voltage swings down only to something less than the DC screen-grid volts and 100 percent linear modulation cannot be achieved. But 100 percent modulation is always undesirable because of the risk of over-modulation.

With a bipolar transistor, modulation can be even more linear because, with the high impedance tuned tank, the device saturates or 'bottoms' at very nearly zero RF collector volts. About 0.7 volts.

Reg, G4FGQ.

==========
Colin,

A real amateur would visit hamfests, look around the junk, take a
selection of the junk home, then sit and think about what he could do
with it.

If you stick out your tonge and pull a funny face, the stall holders
might throw something at you - for free.

The bits and pieces left over can be put towards the next project. ;o)

588. FS: Signal Generator

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-01-27 19:12:06 UTC
From: Barry <n4buq@aol.com>

Source record: 13988

I have an AN/TRM-1 signal generator I'd like to sell. It is a military set that covers LF, HF, VHF, and some UHF as well as containing a test set for a voltmeter and a few other functions. I have re-capped all but the VHF/UHF module (I don't really need those).

This is a '60s era (possibly late '50s) tube-based generator in a rugged metal case. I have the full set of repro manuals and the power cord.

Asking $50 plus shipping. It is rather heavy so shipping may be a bit high. Possibly can arrange to meet instead of shipping. I live in North Alabama.

Barry - N4BUQ

I have 15pcs of old crystals, 9 are FT243, 7 are larger size. Here is the
list:
Channel U 5633.333, CH X 5700, CH Y 5722.222, CH Z 5744.444
CH 9 20.9mc, CH 19 21.9mc, Ch 341 34.1 red dot and no dot, Ch 287
28.7mc, red dot and no red dot, Ch 63 7806.667, Ch 293 6250.

anyone want this bagful for $8 + $2.50 postage?

Yes, and I've looked at them very often. The term "instantaneous power" seems more appropriate to me since it implies a time dependent function, but that is just my prefernce. More below.

> Our 100 watt carrier output transmitter with no modulation is 100

> Remember the definition of PEP: The AVERAGE power out at the crest of
> the modulation waveform.
> (perhaps the "peak" in peak envelope power is a misnomer)

I think it very well is a misnomer, but that is also maybe "my" problem. Defining what we mean, and explaining very technical issues bery accurately is much more difficult than most people realize and sometimes people read things and still don't understand what they are reading. Just about everything you wrote above and below is fine with me except that I've already explained several times in several posts that the problem I always had, for tetrodes and above, is that all the published curves show Ip being independent of Vp and I could not see how, under modulation, there would be enough instantaneous input power to give a 4X instataneous output instantaneous power. Now that I realize that modulating screen voltage can make Ip move in proportion to Vp, and thus give double current at double voltage, my problem with understanding this dissapears. And, this was the major basis for my squabble with the PEP spec on the 32V3 original post. Non linearities are still an issue, but minor. I guess I am just dismayed that nobody is reading what I'm saying to see what I'm saying but they all jump in to talk about everything except the problem that I more or less figured out by myself after re-reading, thinking, and getting some stimulation from the discussions.

But, thank you for your time. You need not repeat yourself any more.

Fine. Maybe next time I see some of his works at a hamfest, I'll take a
look and see if I might want to delve more deeply.

I might add that I've looked at and own one of the RSGB ham handbooks
which are sometimes more detailed than the ARRL handbook. However, I also

want to keep ham radio a hobby for me rather than a vocation (as, say, an EE)

Well, there are a lot of gaps in my knowledge, too, and, yes, I know there are books out there that go very deeply into theory, math, etc.

My other favorite books are the bil Orr (I think W6SAI?) "Radio Handbooks" which I also think are very nice and cover things differently.

Yes, One other thing I was thinking about way back then as to why they could come up with this way of measuring power was that someone told someone else in the FCC somethin glike this: since the books say that in grounded-grid amplifiers, a part of the input drive power gets fed through to the antenna, maybe someone could build some kind of weird grounded-grid amplifier where the final has a DC imput of 1 kW and the final is driven with 5 kW of input drive power and the final puts out, say 0.5 kW and 4.5 kW of drive power feeds through the final and adds to the 0.5 kW from the final to give 5 kW of output with just 1 kW to the final and goes into the antenna and its legal. I don't know, just my wild speculation.

> Probably the biggest reason for the change was SSB. Watching the plate
> meter kicking up and down was not a very accurate means of measuring
> power but in the old day's access to a PEP watt meter was almost non
> existent.

And, scopes were big and expensive, too. Personally I always just looked at plate current while saying "ahhhhhhhh" and multiplying by plate voltage and telling people VxI=watts and that is my "average" power DC INPUT.

And, I've heard, on the air, all manner of misunderstandings of power. I actually heard one guy say "And, I'm getting 700 watts DC output out of my linear" and I was wondering how you get DC out of an RF output SO-239 connector off a commercial linear amplifier. :-\

> Now with a PEP wattmeter it is much easier to read power output than
> it is input power.

Well, I'd rather not trust the needle meters. At least I'd want to check it against a scope with bandwidth high enough to measure those voltage peaks under voice modulation (as I've done with my Ranger).

> Another part of the change was to reduce the maximum power that hams
> were able to use. As discussed the 1 kw input AM transmitter could
> easily have in excess of 3000 watts PEP output and lots more with some
> modulation schemes as you refer to.

Yes, and it all seems so silly to me. I always had the feeling that talking (in the old days) about 2 kW PEP when 1 kW input was the max was more of a ego hype ploy to make people feel they had something when, from a practical point of view, the S-meter was going to be responding to the average power which was easier to measure anyway. But from this one can argue in lots of branching directions.

> SSB also could have well in excess of 3000 watts PEP output as well.
> The old means of measuring SSB power was the plate current meter on
> the final not kicking over the 1 kw DC input level. The meter had to
> have a time constant of less than .025 seconds. No sluggish meters
> allowed. But the average power in speech is only around 10 to 20% and

And, you could have some weird speech waveform with funny transients in it
that spiked up, too. '

Or, if you use a separate, fixed, screen supply, feed the screen through a
10 henry choke.This allows the screen to "float up" to audio frequencies.
I've done this several times with plate modulated 813s, both singly and in
parallel pairs.

It does in fact put out the power he says is does, however to compare apples
to apples he has to plug it in to his 339.36 volt wall outlet. Probably was
recently connected to an 11 meter 63 dB gain antenna.

Cabinet has no dents but has been repainted. Some small scratches in the paint. Numerous scratches in the front panel but all lettering is ok. Rcvr works great, xmtr loads to full output. It has the 100/25kc calibrator factory installed. Inside a bit dusty but not rusty. Power supply is the 230xc, ps and speaker cabinet. PS has original paint, some scratches and works fine. Asking $175 for both plus shipping from 22601. Thanks for reading, Ed KC4FD.

Actually, when the tube(or any other active device) is delivering power into a load, in a class C amp, you have either high Vp and Ip cut off, or LOW Vp and heavy Ip flowing. When the tube is turned on, the voltage should only be the tube "bottoming" voltage. for the 6146 I know best this will be between 75 and 100V, depending on Ip(peak).

The part of the tube curves that determines modulating waveforms, efficiency, and maximum useable loading voltage is the part of the curve where full(peak) Ip is flowign at only a LOW voltage. For the 6146, for instance, that woudl be currents of 400-800ma flowing with only 75-125V. If you were drawing full tube current with all your Vp across the tube, your efficiency and power output would be zero!

Where does the rest of the Vp go? it appears across the load. If the tube was a hypothetical perfect switch, bottoming voltage would be zero, and in Class C would be either all the way on or all the way off at all times. The 120 degree conduction angle common in Class C is used to minimize switching voltage and therefore overlap of Vp and Ip. That overlap and bottoming voltage are the source of the heat dissipated by the tube. Class E and F amps use different tuned circuits to get zero switching votage and efficiency as high as 90%!

If the tube were a perfect switch, and the conduction angle were constant with respect to Vp, the resulting amp would give perfect linear plate modulation! This is becuase the load should be a pure ohmic resistance at resonance. The reason it does actually work this way is that bottoming voltrage runs up fast as Ip is increased, cutting the efficiency of the tube and cutting the percentage of Vp that appears across the load. If doubling the plate voltage only raises the voltage applied to the load by 90%, it will only increase current by 90% at most, meaning the power increase cannot be more than about 81%!

This is why a little grid modulation added to plate modulation(ESPECIALLY WITH TETRODES/PENTODES!) does so much for the modulation characteristic of the amp. This is also true to a very severe extent of MOSFETS, BTW. Solid state AM is utter hell to modulate and I suspect will never sound as good as tubes. you know, just like transistor guitar amps sound like garbage(but for different reasons).

To design an AM final for plate modulation, begin by figuring desired PEP, which is four times desired carrier power. Now select a tube(s) and operating point that will make this power at a reasonable efficiency. If the amp can run key-down at this level, great, but this is not necessary in any way. In teh real world, this would always be

over its thermal dissipation rating.

In other words, if you ran it without modulation at double plate modulation, it should run with good class C efficiency unit it overheats from being too small in dissipation rating! It must NOT be overloaded to the point that efficiency is dropping. This sets the loading used on the amp as built, tuned, and run.

When operated at carrier, it will be at a rather light loading compared to the CW ratign for the same device. It could make more power, but you'd never modulate it. Do NOT increase the loading. At carrier, it will still make somewhat over 1/4 the PEP power, due to greater efficiency at the lighter current. Becuase your efficiency waqs good to begin with, this difference will not be severe.

A small amount of grid modulation is now introduced. On a triode, the use of grid leak bias has this effect, as grid current falls with rising plate voltage durign the switchin time of a real tube. On a screen grid tube,you put a choke or tertiary winding in the screen supply. If you just rran the screen all trhe time at enough voltage for the PEP condition, you would little too much carrier power.

The point of the grid modulation is this: it reduces efficiency just enough at carrier to be the same as the efficiency at PEP. This, in turn, is one of the reasons the PEP efficiency must be good-otherwise you now always have poor efficiency.

Suppose you are designing a final for the amateur limit of 1500 wats PEP output. You are NOT going to design a 325 watt(the carrier power) amp! Thermal loading will be on a sine wave signal about that of a 437 watt class C amp, but the amp must not clip or round off the current pulses at 1500 watts output and double plate voltage. Essentially, your tubes must be able to efficiently MAKE 1500 watts, even if they can only get rid of 200 watts of heat in the process.

I learned about this the ahrd way, on MOSFETS for a MW application. Two IRF 510's could make 50W carrier but wouldn't modulate worth garbage. To get acceptable modulation requred backing power off all the way to 27 watts and then still needed an assymetrical modulating voltage.

Viewing the modulating voltage on the scope proved the modulator to be adequate when wound for a normal syymetrical output waveform, leavign the Class C amp as the culprit. To fix it right too four of those little MOSFETS, and 2V or gate modulation from a tertiary winding. Just forward biasing to handle the current didn't cut it. This gave 45W carrier, with still a shortfall in PEP, but now only the shortage predicted by the power supply voltage sagging about 3/4V out of 16V. The heatsink runs very cool at carrier, and doesn't get too hot even with the modulator running flat-out.

A pair of 6146B's of course, with a pair of 6550 audio tube as a modulator, would have been able to pound out several times that much power! Still, they would never, ever be able to make four times the CW

rating from the tube manual simply by applying twice the CW plate
voltage. Similarily, to run the same current at carrier as in a CW rig,
they would need a lot more drive, as at PEP the plate current would be
higher, as high as the current drawn in a low-impedance VHF rig.

It may just be a bandit, of course. (Someone is/was auctioning a T1154/R1155
setup that was sold a few weeks ago in England (the buyer is in England and
very happy with it, apparently); but... the same items (including serial #s)
reappeared for sale in the US. Very Suspicious.)

I have a nice working Mosley CM-1 with the matching speaker. Also have a photocopy of the manual. Receiver works good and looks good. There are some scratches but not bad for a rig that's 50 years old. It has been retubed with all nos RCA tubes. Total recap of all the bad caps, has all the right knobs, no extra holes, not dented. This piece of equipment isn't all that rare but hard to find with a matching speaker. Make some collector very happy. Easy tune, rock hard stability after warm-up.
I have pictures available on request.
Asking $600.00 plus shipping.

617. Central Electronics 20 A Phase shift question

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-01-29 17:13:52 UTC
From: Ron H <rnharsh@attbi.com>
Message-ID: <lJ6Df.7716$XG4.7514@fe14.lga>
Source record: 13867

Setup:

CE 20A to dummy load
1 KHz audio input tone
scope accross the output of the phase shift network (90 deg shift)

Observation:

The X-Y scope display shows a very nice circle which varies in diameter with the amplitude of the input and also varies in diameter (although less variation) with the input frequency. The inside of the circle always looks to be a well defined circle but the thickness of the line has some variation around the circumference. Thin and sharp at 6:00 thru 10:00 and a little thicker from 12:00 to 2:00.

The two signals look great in the time domain just like two sine waves out of phase.

Question:

Is there something going on that needs correction?

K3PID
Ron H.

Ron,
Are you chasing a specific problem in your exciter or are you just exercising your test equipment? How is your suppression and voice quality?
It's been over 40 years since I fooled with Lissajou patterns on a silly'scope, and that was in electronics school in the Army. But I do recall that any stray signals, hum, or any distortion of the sine waves will blur the image. Is your 1kc tone pure and clean? Seems the 20-A manual calls for something a bit higher like 1225.
You're the first 20-A owner I've ever run across who was scrutinizing the output of the PSN with a 'scope.
I always just tweaked everything for maximum sideband suppression and let her rip.

When I built my first SSB phasing rig in 1958 (the infamous W2EWL design), I borrowed a friends Heath AF generator and silly'scope, and spent hours trying to get it right.I finally learned to do it by ear by adjusting everything for minimum modulation with tone input while listening on the station receiver.

I acquired my 20-A along with a Lakeshore VFO in 1964. It is still my primary station exciter today. I use it to tickle the grids of a trio of paralled 807's or the final stage of a Johnson Valiant.

John

Thanks for the FYI. I've heard all kinds of funny stories and I'm not an expert on eBay stuff, either. There could be "operators" who just set up multiple userids on eBay and sell the stuff to themselves (who would find out?) but the rising prices get recorded somewhere and someone I know who knows a lot more about how to do this says you can look up recent past prices for specific things. Then, if you do this, it looks legit and -- guess what-- it credibly pumps up the "going" price on stuff. I was looking for some boatanchor receivers a few weeks ago and saw bidding going --as far as I was concerned--beyond what I would consider as reasonable. I backed out.

I do the same thing! Adjust the side band suppression by listening to
the opposite side band while talking. It seems to work better than
with a tone as the 20A's have considerable hum in them which distorts
the tone ripple on the scope when you get down to low levels.
It also is easier to get the side band suppression balanced on both
side bands that way too.
If you use a tone one side band will end up with more suppression than
the other and you have to work back and forth to get it somewhat
balanced. By talking and listening it comes out better.

Gary,
That's interesting that you mention using your own voice rather than injecting a tone for suppression adjustments. A long time ago I thought about making a continous loop tape using my own voice with a long "hello" for that very purpose.

This particular 20-A is factory wired and no adjustments have ever been tweaked with exception the two audio balance pots and the driver circuits on the upper bands. All the 9mc.RF slugs still have the little blob of grey paint on the threads. All I've ever done to it was to replace the cathode resistor in the VOX relay tube. It's value had crept up and I really had to holler at the mic to get the relay to pull in.

I use it more often than not barefoot just for fun. It's been a good rig for the 42 years I've owned it.

John

Hi John,
Guess we are on the same page for side band suppression adjustments!
I started out building my own phasing rig in the early 60's too. Then
got a 10B and latter a 20A. I have had several 20A's over the years.
Traded them off and a few years I would pick up another one.
The one I have now I drive a pair of 6146's (driving the grids) and
they drive a pair of GG 813's. It is a fun rig.

Over the years I have had various configurations of 1625's in GG that
I used with the 20A as I am sure you have too.

I have a lakeshore vfo too that I need to put on sometime. Picked it
up a few years ago and never hooked it up.
I use the 458 vfo. I was lucky enough to find the 10 meter kit for the
vfo so have that in it too. Although the crystal in the converter
drifts quite a bit. It runs off of unregulated voltage. I need to find
a way to regulate the oscillator some day.

If you haven't done so on your 20A, there was a recommended
modification to put a resistor in series with the relay coil so if the
control tube shorted it would not burn out the relay. That has
happened to several rigs.

I assume you mean the audio phase shift net...

This suggests another signal getting in that is somehow affected by the
audio voltage level.

What you describe could be related to the scope astig adjustment.
or
How about RF in the scope. Kill the RF somehow.
Or power suppkly hum.

Probably because the screen and supressor grids are not the main
controlling grids, but are there only to reduce Ip vs. Vp and control
secondary emission off the plate respectively.

> >>> Lets look at the venerable 833 (from my RCA TT-3 transmitting tube

OK OK TWO comments...
I think someone else pointed out that this is a static situation and in a
circuit, the supply voltage and the plate voltage are not the same thing
when you have a tank circuit in there.

While possibly (probably) true... DC was easy to measure (by hams) and RF
power difficult to measure in the early days. As time progressed, RF power
became easier to measure and, after all, was the thing which would cause
trouble as far as interference was concerned.

Just a question that has been rattling around in the gourd. What age group are B/A enthusiast-type folks here on the Net? I know we have the folks from when they (the B/A's) were the most active (and I'm talking SX11 here), but I wonder if there's a large following of Boomers that picked up on it too. I only say this because I don't see as many 30's-40's-50's people at the Hamfests and other gatherings as I see my elders (Gentlemen, all). So the question bubbles up outta the tar? How old are the folks on rec.radio.amateur.boatanchor?

> And the old Heathkit clock still ticking!!!! Amazing!!

Ken Kuhlman, former "General Products" Heathkit engineer died of kidney
cancer on January 24th.

Ken grew up in Kansas and developed a deep love for electronics as a teen.
While he never got a ham ticket, one of the first electronic projects he
built was an operating telegraph system running between his and his
brother's tree houses. He graduated from Wichita State University with a
BSEE degree in 1964, and worked at Heath for over 25 years.

During his tenure he developed many very popular kits such as the GR-1075
Digital
Clock Radio and also contributed to the automotive products group, as well
as testing and development of the Heath/Zenith laptop computer products. He
was an avid car fan and had restored a 1957 Austin Healey, which he loved to
drive around on any warm day with the top down.

I was privileged to work with Ken a little at Heath, and for several years
shared office and lab space with him at Whirlpool. Ken always commanded
respect for his knowledge of most anything electronic. He retired in 2002,
but returned a couple of times a year to keep up and say HI. He will be
greatly missed by all of his friends, wife Judy, kids Tom and Molly, and 3
grandkids.

I'm 59. Got my Novice late in 1962, and my Second Phone in 1963. Laid
out of ham radio until Jan 2005, when I got my General, but was doing
BA electronics all along, for Lockheed Missiles & Space, Lockheed
Electronics, the Air Farce, and various universities.

48 - will be 49 in a couple more months. Have been interested and screwing around with Electronics since I was about 8. Took electronics up in High School shop. Got Novice ticket in 80, moved up to Tech about a year later. Moved to Extra about 8 years later. Went on to get Commercial license. Own my own electronics company.

Even us guys with a commercial ticket used DC measurements to determine input power; it wasn't a ham thing. Watt meters were used on lower powered equipment, but it wasn't a requirement. Your "after all" comment is silly.

52. Got interested in elctronics in 5th grade, 1964-65. When I moved to a new house a neighbor gave me (now long gone) two ARRL handbooks from the 40's and 50's but was not a ham. I read those until they fell apart.

Never could learn the code and went into computers instead.

In 1993 I earned a no-code tech. I tried everything that I could even to the point of talking a cpo on the train to work and talking to myself in morse code. But I never could copy enough to pass.

I asked the local VEs and then the ARRL VEC about taking a sending (only) test and they refused without a doctor's note. I then found out about Code Quick and learned to copy in about 2 months.

I got as far as the 13wpm test and then had to stop taking tests in preperation for moving here. When I left the states in 1996, I was able to copy about 35wpm. But could never get above about 10wpm with a straight key. I've never been able to "get it" with a bug or a keyer, my brain is not wired to think in letters.

The U.S. advanced was good enough for an Israeli extra license. I had not used it in years and have recently gone back on the air.

Radios are rare here so there is no chance of building a boat anchor collection. Each transmitter must be on your license and an import permit is needed for them.

What I do have is usefull and still works well, a Drake TR-5, Ten-Tec Triton IV digital, Argonaut 509, and a "modern" rig, a Kenwood TS-430s.

Well, if he says it's not, then it is. ha.

What's really troubling is what if martyn and gottahaveit were not
"pushing it a little too far."

What if, he's smarter than that. Say he has two or three shills,
they bid up an SX-100 or whatever to irrational heights, do it
two or three times. It's a private auction so we don't know what's
going on.

Then he actually puts one out and without too much shill action gets
even half that price. He walks away with real money.

Interesting thread.

I just turned 47 last week. Got my Novice in July 1977 while in College at Delaware Tech (club call sign was WB3CSM; long since defunct). Upgraded to General and then Advanced within just a few months. Finally got around to the Extra in 1990. Got the vanity call in 1996. Always a CW operator, not much fone. Been a fan of tube gear and of QRP ever since the beginning. I can't recall a time when I didn't have some of each kicking around the shack. Not a collector; more of a dabbler. I buy 'em, fix 'em up, make a QSO or two, then sell 'em. My fun is in the repair and restoration, I guess.

Looking back over my nearly 29 years of hamming, the majority of folks at hamfests have been made up of two groups: old timers and very-newcomers. Still that way today. I think the mainstream hams do more of their shopping on eBay and the 1-800 numbers.

There's plenty, if you define the boomers as those born between the late 40s and early 60s. Probably the majority on this group, as we are the most likely to have some sort of interest in both computers and vacuum tube electronics.

>I only say this because I don't see as many

I'll be 49 in a few days. Although I'm not a ham, I've been to a few hamfests. I'd guess the bulk of the guys at the fests were retired guys, but that might only mean that retired guys have more free time. But it's my sense that younger people have less interest in vacuum tube electronics, and most of what interest they have is in hi-fi audio and guitar amps.

If buyers got the idea that SX-100s had somehow become worth at least 500 bucks, then so would sellers. There's hundreds of nice SX-100s out there, and if only a fraction of those SX-100s end up for auction on ebay, then they'll be selling cheap, assuming the bids are coming from real bidders and not shills.

Hi,

I'm helping a friend restore a 1937 Utah UAT-1 CW transmitter. Each contro on the front panel has a small metal label under it. Unfortunatley two of them are missing. These are the "Oscillator Tank" and "Oscillatorm Plate" tags. They are the typical black, tow hole plates with solver lettering. Approximately 1 3/4" long and about 3/8" wide.

Can someone point me to a source to buy these or suggest an easy fabrication method?

Thanks,

Jim

Many of those "retired" folks had some good electronics backgrounds. Even if they were Mill workers - Coal Miners or the like, many ended up doing repairs to the equipment. So, don't let yourself be fooled that "all" these "retirees" were late comers into the hobby. Many of those "retirees" have ham set ups that would rattle your imagination. Then too, some of them would tell you - they grew up with radio but never took the time to get into it, and now that they're retired, they want to do so - so in that case - your

assumption would be correct. The hamfests I go to are still pretty well populated by young and old alike. Maybe not too many "young" under say 30, but a handful. Enough to make me believe the hobby/profession isn't dead yet. As to those over 20 to say 40 - maybe not as populated as the retirees, but not far behind.

Now for my 2 cents as to the above post (respectfully)

Though many of the parts available at the time Vacuum tubes were used - were still available with transistors/ICs - and many still are yet today - isn't so much the reason for lack of interest. This argument has raged for the last few years at various times and even recently in another group. SMT has chased many away, but still - with all the "parts big enough to see and solder" without an Electron Microscope and thousand dollar soldering set - the younger group has seemingly NO interest. The SMD isn't the only reason.

As I said in another group - you would think - that as much as these kids seem to be into computers (or were) - video games, cell phones, etc..... some would want to get involved. I said also that yes - though Cell phones and the like are created in China or where ever for sale here - the fact remains, someone still has to maintain the cell sites - and it takes knowledge to do that. We can ill afford to allow our technology and maintenance to be exported. When we cease "maintaining" as well, we're done. Our Technology then, may as well be tube state - because if we can't fix it, those who seek to destroy us would have an open hand at doing so. If the armed forces are the only way to get these kids to train now days, we're in trouble. The armed forces couldn't possibly keep up the pace.

Just my 2 cents...

clf

Huh? How was I stating any assumptions about when hamfesters got into the
hobby?

>The hamfests I go to are still pretty well

Well, the topic was interest in boatanchors. If you're saying that there's
almost as many people between 20 to 40 with an interest in boatanchor radios
as people over 65 -- you've noticed something I've missed.

Well, they sure sell a bunch of fancy video cards and other such
computeralia at Best Buy and Circuit City and Fry's. I'm assuming the
buyers are the gamers who are into upgrading their computers, much as the
hot-rodders of my generation would buy manifolds and camshafts at the speed
shop.

Military threats are so last millenium. Given our huge trade deficit and our enormous foreign-financed budget deficit, they'll just fly over and buy everything with what used to be our money.

Perhaps a poor expression of intent, but my intent was that it is the output
power which the FCC (or equivalent) is concerned about, not input. As long
as it bacame more feasable to measure output power, why not use that.
Perhaps explicitly stating it was stating the obvious, but it was an attempt
at being complete--sort of a flame insurance.

I understood your post as if you would like to gain some understanding (without having to consult Terman) on why the voltage & current figures you read on your RCA TT-3 manual for the 833 tube do not apparently match the 400-W peak-envelope-power figure commonly quoted for a 100%-modulated 100-W AM carrier.

In my understanding, there are two main issues that you did not consider in your reasoning:

1) the voltage / current pairs you quoted for the 833 tube correspond to a fixed grid voltage (either 0V or -50V). In practice the grid voltage is sinusoidal (at the carrier frequency) and, for a class-C amplifer, it only causes plate current to flow when getting above the interdiction threshold. So, plate current only circulates for a fraction of the RF cycle (<180 degrees). Therefore plate current is not sinusoidal and its average value (along half a cycle), i.e. what you read on a DC meter, is closer to the peak value compared to a purely sinusoidal waveform. When plate voltage varies due to modulation, the grid interdiction threshold varies and so the circulation angle does. This turns into a change of the average-to-peak current relationship. That said, it immediately follows that simply taking voltage & current figures at a fixed grid voltage would not make much sense. All what said does not take into account the presence of the plate tank circuit which, as someone else has noted, yields a remarkable effect on actual plate voltage & current figures

2) the modulator is designed to feed a given load resistance (depending on the modulation transformer winding ratio). If the modulator load (i.e. the class-C final stage) does not show a linear current / voltage relationship, the plate voltage will, partially, self-adapt itself along the audio-frequency cycle, thus smoothing the tube non-linear behavior.

In addition to that, there are other effects (like the grid leak bias causing grid voltage to somewhat follow the modulation) that someone else has already pointed out.

The above arguments do not provide a justification of why a class-C tube shows, in practice, a reasonably linear voltage / current behavior, but they should at least give you sufficient evidence why your reasoning is way too simplified to credibly deny the 1:4 PEP ratio of AM-modulated signals.

That's a 9QL pinout. Same pinout as the 6JE6, 6JF6, 6JU6, 6KM6, 6LQ6,
6LZ6, 6ME6 tubes. If you have any of these listed on the chart, set
the switches up the same way.

I _think_ the bias setting should be the same. So get a known-good 6JB6,
put it in, and adjust the shunt until the meter reads good. Now try your
unknown tubes in there.

Don't trust this sort of back of the hand estimate for exact transconductance
values, but for a rough go/no go, you should at least be able to cull out
the tubes that have substantially lower transconductance due to low emission,
shorts, or badly damaged elements.

God, how I hate sweep tubes...

This one is older than you, sonny! First two receivers built in 1941
(neither of which worked as "liquid solder" didn't seem to be a very good
conductor). We used condensers, and resistor color code was "body, end,
dot". After long struggle to reach 13wpm with a stick, got class "B" license
in 1948. Class "A" not until 1950.

Are you looking for an S-38, rather than an SX-38?

If so, there are a number of versions, including the S-38, the S-38A, S-38B, S-38C, S-38D and S-38E.

If you are not familiar with these radios, the S-38, A, B and C all have 2 half moon circular dials. The D and E are large slide rule dials.

There are many around and they are fairly inexpensive for old radios. Mke sure you get one that is restored so that you do not have to service it. It is easy and inexpensive for a competent hobbyist.

They are a classic radio, so enjoy it.

You can wire these anyway you want, (well at least old school hams did)
That mic's been sold.

Yes Jack
That clocks been going since 1975, with perhaps a 4 year break
I had to bring the anode up to around 220 volts a couple years ago with a simple voltage doubler mod.
It also has a smaller Sperry display on the seconds the original went completely dead
Sperry SP-352's are a hard $$$ find in 2006

This one is older than you, sonny! First two receivers built in 1941 (neither of which worked as "liquid solder" didn't seem to be a very good conductor). We used condensers, and resistor color code was "body, end, dot". After long struggle to reach 13wpm with a stick, got class "B" license in 1948. Class "A" not until 1950.

Brian,

Without going into the technical aspects, I'll simply say that a double-conversion superheterodyne receiver offers improved sensitivity and selectivity over a single-conversion superhet. In the early days of CB (ie, the 1960s), the majority of CB sets used a single-conversion receiver, while some of the high-end models used double-conversion. As CB became more populer in the late 1960s and more stations came on the air, it became necessary to improve receiver selectivity to reduce the problem of "bleedover" from adjacent channels. With that in mind, the majority of CB manufacturers began using double superhets for even their "cheap" radios, and from then on it became standard practice.

If you would like to learn about the technical reasons for all of this, pay a visit to your public library and look for an ARRL Radio Amateur's Handbook, and read up on receiver theory and design.

Since citizens band is operating at about 27 MHz, the standard i.f. of .455 MHz allows an image of twice the i.f. frequency (.91 MHz). This image is not rejected by the tuned circuits of the cb rig. So, double conversion is used. In this specific case, the selectivity is not increased, but the image rejection is. Often the first i.f. is in the 5 to 10 MHz range. Recently, with the use of low noise mixers, the first i.f. can be at 40 MHz or higher, which provides excellent image rejection.

Bottom line is that most cb radios that are average or better use double conversion. In the case of your GE unit, the marketing department decided to add a little hype to an rather ordinary cb unit and called it a Double Super Hetrodyne. Is your radio a special radio? No. Is it worth more? No.

Yep...may check as new on a tube tester...may still work 80% on 80
meters and may have very low output on 15 or 10.

I think it was Drake and the 6JB6s? I believe they specified Sylvania
brand for their xmtrs. It proved true to me. Tubes ordered from them
always got the best output on 15 and 10.

The straight answer? Double conversion is used to reduce images.

It does nothing for sensitivity or selectivity in itself; and it probably
decreases dynamic range and makes the receiver more prone
to spurious responses.

The chassis should have intergral electrical insulators that
isolate it from the cabinet.

Personally, I'd use a polarized grounded plug to insure the case was at
ground
potential (while maintaining the insulators to keep the neutral side
isolated).

The original S-38 had six tubes (dedicated BFO instead of a regenerative
IF), so it might be the more desirable from a boatanchor tube count aspect..

Uncle Peter, you're right! The operative words are "should have". But,
as Dirty Harry once famously asked, "How lucky do you feel?"

As long as the original poster realizes that all that is between him and
an eyeball rattling shock is 4 crumbling, rotted 50 year old rubber
washers that may or may not even be there, then he'll be OK...

Just turned 60. Still can't believe it.
Got my ticket in 1959 or 1960. My first rig was an S38 receiver and the transmitter was a home brew 6AG7 and 807 built from scrounged TV parts. When I got my general I cathode modulated it with the power amp of an old Broadcast radio.
Next was an ARC5 on 40 meters. I got a Knight T50 somewhere in that time period too.
I put the ARC5 on DSB and got hooked on side band.
Then I built a phasing type SSB exciter and various amps. Still in high school and no money.

The S38 I had didn't come with an RF gain control so trying to copy CW on it was next to impossible as it would overload. Added a pot in the IF cathode for IF gain. Made a new receiver out of it. Later added an old beacon receiver tuned to the IF for a Q5R. Then added an ARC5 vfo to use as the master oscillator. Then I had a very stable and selective SSB receiver. I called it my "S line receiver".
As a kid that's all I could afford.

My first commercial side band transmitter was a Central electronics 10B then a 20A.
I built a converter for a BC453 and had a better SSB receiver then.
I still have a 20A that I put on once in awhile but it is not the original one. I have owned several over the years and have traded them for something.

I still have the BC453 and have revised the converter several times. The rig now has avc and product detector. I drag it out every few years and make a few improvements on it then put it back on the shelf.

I didn't get my first "real" Collins S line until around 1976. I think I still have that too.

I do have modern gear but still collect and like the old stuff.

A coil-loaded counterpoise at a low height above ground is used to provide an artificial ground for an antenna when, for some reason, a true ground connection is not possible or there is not enough space to erect a full 1/4-wavelength horizontal wire.

The principal effects of low height are a loss resistance induced in the wire from the ground, and a reduction in propagation velocity along the wire.

A counterpoise can be considered to be an artificial ground. Its input resistance at resonance is equivalent to the input resistance of a true ground connection but its resistance will never be as low as a good ground.

To provide a lower input resistance three or four counterpoises can be used in parallel. Or they can be resonant on different bands.

New program C_POISE estimates the performance of a single coil-loaded counterpoise. The number of turns on a coil of given length and diameter needed to resonate a low wire to 1/4-wave resonance is calculated. The input resistance at resonance is also estimated..

All program output data is approximate due to the very low height of the wire above ground and uncertainty in the characteristics of the soil or whatever other materials may be under the wire. The wire may be allowed to rest on the ground surface but uncertainty will be at a maximum. It will nearly always be needed to prune the wire length for resonance. Or when the wire length is fixed the coil turns may need adjustment.

When wire height exceeds wire length accuracy is much improved. Input resistance at resonance will be fairly small. Working Q will be high and the counterpoise will behave as a short antenna. For precise resonance the wire will still need pruning.

Download program C_POISE in a few seconds from website below and run immediately.

711. National Corp RCP schematic

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-02-02 02:56:03 UTC
From: AB9GO <randallr@healthall.com>
Message-ID: <1138848963.240455.308400@g43g2000cwa.googlegroups.com>
Source record: 13761

Hi,

Looking for a schematic for a National Corp. RCP receiver. Tried BAMA

site but no joy. I have had this receiver over 20 years. Used to
listen to cordless phones when they used 1.8 & 46 - 49 Mhz split. It
was amazing how far that 1.8 Mhz signal would travel. The base used
the house wiring as an antenna and I could hear classmates talking
about all sorts of things! I was good enough at one point to be able
to count the dial pulses and get the dialed phone #. It is time to
restore it and use it for a SWL receiver. It was a modified NC-100 for

the CAA/FAA from what I have been able to gather. Any ideas where a
schematic is online?

Thanks,
Randy.

<snippety>

Yes. It gives the marketing dweebs something to write about.

> I have a GE 40 channel cb and it has Double Super Hetrodyne.

There is a possibility -- a very weak one -- that this bizarre market-speak means that the radio was designed with a double-conversion receiver. It's impossible to say without seeing a schematic.

Why anyone would put that much effort and expense into a CB radio, however, is beyond me. I think you're running into nothing more that marketing buzzwords. "Double Super Heterodyne" certainly has no meaning in the technical world.

I think it means something equivalent to "has ears and barks well into
the next county bubba 10-4 beep".

Okay, that was a nasty shot but there were indeed double-conversion rigs
back in the CB heyday. When every other trailer in the court was
running kilos of Bird-watts double talk conversion had its advantages.

We're 10-8 and on the side bubba 10-4? beep. Gotcha comin on. Beep.

I really don't know this lingo...I'm reading it off the side of a 1970s

Message-ID: <43E1B42B.6030601@aol.com>
Source record: 13765

Hi,

I've just gotten my Central Electronics 20-A working nicely on cw into a dummy load on 3595 KHz using my one crystal. I've got a VFO 457 and VFO 458 that I'm wanting to begin using for my first time. I'm starting with the 457 and could use some help.

Instead of a 0C3 tube the unit has a 0D3.
Instead of a 1626 tube the unit has a VT135/12J5GT tube.
The second 1629 tube has not been removed (no wire to top cap)

The "Basic Modification of the BC-457, BC-458 or BC-459 as a VFO for Model 10 or 20 Multiphase Exciter for 12 Volt Operations" states at one point: "Remove the 1629 eye tube and also the 1625 located near the tuning shaft, Jumpers should be installed across the filament terminals of these unused sockets."

I'm guessing having the second 1625 installed without a wire to the top cap might be just to provide the jumper across the filament terminal for its socket. I don't know where the 1629 eye tube used to be. I also wonder why the 0D3 and VT135/12J5GT are installed.

I am thinking this VFO 457 was modified and working many years ago. This VFO 457 was hooked up to the 20-A when I got both units. Thanks for your help on the VFO 457 or any comments about the 457 vs the 458 since I will be trying to get both working but focused on the 457 for now.

Source record: 13771

Q. Instead of a 0C3 tube the unit has a 0D3.

A. Just a different regulated voltage. No magic about voltage. In fact, the builder may have found that the different voltage may have offered better stability - or it could have been he had one on hand.

Q. Instead of a 1626 tube the unit has a VT135/12J5GT tube.

A. Should be an equivalent tube. No big deal. A triode is a triode.

Q. The second 1629 tube has not been removed (no wire to top cap)

A. You apparently mean the 1625 power output tube. Should not make much difference. Maybe the builder did not have a place to put it. The original BC-457 had tubes in filaments in series - parallel so it could operate on the aircraft 24 - 28 volts. Most hams converted the wiring to 12 volts by paralleling everything. I recall most conversions supplied a separate filament transformer, and as long as the voltage required is equal to the transfromer voltage, you are fine.

Hint, if it worked once, and no one rewired it, it will still work - unless one of the components has died due to aging.

All the BC-457 conversion does is to use the triode oscillator circuit as an external vfo. Output from the vfo is taken from the grid circuit in the BC-457. It is a very easy circuit to understand.

For 80 and 20 meters, you use 5 to 5.5 MHz. For some of the other bands, you must multiply the frequency of the vfo. That was often done in the 1625 section. But, much of the operation of the CE was done on 80 and 20 and the fellow who installed it may not have gotten any further.

Generator is still for sale. I can supply pictures. Price reduced to
$40 + shipping.

As for the VHF/UHF module, I think the first band works, but not sure
about the others. I'm pretty sure they may need work, but like I said,
I didn't bother with it as I don't need those bands.

BTW, the modules are pretty easy to remove from the main frame where
you can work on them "out of the box".

Also, this is a CW/AM only (no FM) generator.

They designed and built good radios, because people wanted and needed good
radios. In the beginning, there were more lofty ideals for CB; it wasn't
the cesspool it has become, but that doesn't mean it's useless.

Many CB radios were so good they were converted to 10M and were appreciated
for their advance design.

Don

A funny story, Years ago I used to work on HAM equipment and ran a small shop out of my basement. One day a CBer showed up with a Browning radio. After repairing the fault, I noticed a design flaw. A capacitor across the B+ was on the wrong side of the transmit relay.

It allowed sufficient B+ to keep the transmitter alive when the unit went to receive and caused a feedback "ping".

I corrected the default in design and returned the radio to the owner. He came back mad as a wet hen because his "Browning Ping" was gone. Being the curmudgeon I am, I put in a LARGE cap extending the ping to nearly a second. I thought that would really piss him off. Sad to say I had a wave of CBers wanting me to fix their pings like the first guy.

For what it's worth, the Ostermann shortwave book describes it as "scarce." By comparison, the Hallicrafters SX-73 is described as "very scarce," and the SX-88 as "extremely scarce."

As for performance, I have never used one. The book says it is double conversion, 10 tubes.

From memory, the 1629 (magic eye) tube was at back left, an octal base crystal
was fitted to the middle socket (the pair of these provided crystal calibration
at 4.6MHz (on the 4 - 5.3 MHz unit), and the 1626 oscillator triode was in the
right hand socket. If it still has the top case, the hinged flap has a mirror
fitted over the 1629 position so that you can see the eye from the front of
the unit.

The 0D3 is just a regulator to stabilise the oscillator HT.

Chris.

NC-155 was one of the National Cosmic Blue receivers
had one for a few years, back in the mid 80's
performance, better than most cheap receivers
but nothing special
Drake 2A,2B, Hallcrafters SX 117 will run rings around it

cosmic blue line did not became popular
National had some back cover ads
for the Cosmic blue receivers mid 60's 73 magazine
in 40 years only seen 4 or 5 of them in the flesh

Your are right, the ones with the half moon circular dials on each
side. I am looking forward to finding one here in Florida. If
someone has one at a reasonable price, I would be very interested. As
I said, I really want it for old-time's sake. My whole house is
decorated in Art Deco 1930's and 1940's style. I do not know anything
about fixing them, but would like it to be in good working and
cosmetic condition.
Thank you,

If you are interested in Imsai, you can buy
a new one from the legacy manufacturer:

http://www.imsai.net/

They are remanufacturing the original, with a
more modern Z-80 instruction controller card, and
manufacturing a look alike with standard PC guts.

Gary,

I thought I was clever using my voice instead of a tone! Hey you beat me
to it. I figured it would be like a sort of sweep generator for audio. I
make a nice long tape of cq cq cq from wa6lzh helooooo and twek it down
to wear I can barely hear the opposite sb. HT-37 never gets a bod report
now if I can slow that drift down a bit.

73 Tony WA6LZH

BTW The Heat Sideband Adapter (Outboard phasing w band switching) Manual
has an excellent explanation of the phasing method and adjustment
techniques.

Gary Schafer wrote:

Source record: 13595

Hi,
I have a slightly sick Cushman CE50-TG-1 service monitor and was
wondering if anyone has taken any voltage readings from a working unit
they would be willing to share.
I need to check the voltages at test points 3 & 4 on the 29000 board
with the frequency set between 9.9999mhz and 100khz. That should give
me the normal range for both the A & B VCO's control voltage's.
(referenced to chassis ground) Any other voltages would be helpful so I
can note them for future reference.
Sure would have been nice if Cushman would have provided some basic
voltage readings on the schematics.

Any help would be appreciated,
Thanks,
RoD

Occasional browser here at B/A.
Was 11 when W.W.II ended. Got interested in 'electricity' at 12, while living in an all-gas house in NW United Kingdom.
My Elmer was an uncle who gave me war surplus stuff, some of which I still have.
Built first radio at age 13, completed after dropping a glass 6K7 that cost me several weeks pocket money! :-(
Then got interested in war surplus 'Command Rxs', admiring, as I still do, their practical and neat construction.
Learnt a lot, then spent 40 years in telecommunications industry in Uk and Canada. Retired from that in 1992 and spent 12 years in the catering business. Finally retired in 2004 again tinkering with electronics. Took 'transistor' course at local college of technology in 2005 scoring 80%+, so grey cells in this gourd still active; I think! Age 72 in a few week.
Warm regards to all who post. Terry

59. Novice in 1959 (12), general 1960 (13), FCC first with CW endorsement 1961.

Grew up in NJ, with monthly trips down to NYC's "Radio Row" on Cortlandt Street, and the many surplus electronics stores along US 1 in northern NJ. Hauled many a BC-348 and BC-454 home on the train, to my Dad's dismay. (Although he did even help me put up a 50-foot telescoping steel mast in our back yard. 8;))

Worked through high schools repairing tv's in a local shop, and operating mostly from the local high school station (WA2GVV, with a DX-160 and HQ-170A), YMCA (K2YNT), and local Civil Defense office.

Drafted out of college in 1966, so went down and emlisted as an MOS 05 radio operator, but wound up in OCS instead of Ft. Monmouth.

Gave up operating around 1992, when I figured new call sign policies, incentive licensing and USEnet had killed ham radio, but still keep my cw skills up by listening on a 2C and an R-8500.

-- Larry (ex WA2QCM)

Many CB radios were so good they were converted to 10M and were
appreciated
for their advance design.

Don

advanced design?
sry om had nothing to do with advanced design

cb radios were converted to 10 meters
because they were cheap and easy
often conversion took little more than one rock and alignment

could pick up all kinds of non runing cb rigs for free
often took only a hour or two and few junk box parts
now had free cb rig ready to convert to ten meters

brand new surplus High Gain 23 channel boards
sold for as little as $12.99
less if you bought more than one board
no case, no knobs, no pots no meter or switches
few hours work, few parts
now had cheap kick around ten meter qrp lash up

at one time there were at least 25 ops
in and around Detroit running converted cb radios
don't think any of us, had more than 100 bucks invested

yes there were some very well made cb radios
there were some very poorly made cb radios

it was not advanced design
that caused so many to be converted to ten meters

Hi,

If you go to wikipedia.org and search for "superheterodyne",
it will explain the concept. The "double conversion superheterodyne"
is explained in the wikipedia article, as a method of improved receiver
image rejection. The article has plenty of links to lead you
to further information, if desired.

Don't apologize, you are correct that there were both good and mediocre CB equipment available..... So what's new? Same with ham gear.

Some if us went for quality, not cheapest. If you convert crap you still had crap. Mine was dual conversion and had a great noise canceller.

Don

Thanks, but it didn't seem like a big deal. Several of my friends did the same thing -- we had the two very active local clubs I mentioned, and the FCC testing office in NYC was only 45 minutes away by train on our frequent shopping expeditions.

The first did come in handy years later when I was working for RCA and they had their big strike, and hundreds of us non-radio/tv station employees filled in. 8;) Other than that, I never used it for employment.

I don't miss the redundancy of short QSOs, but I did love cw.

I really wasn't referring to the 1st class ticket as an aid to
employment (although it was a viaible credit in those days). I'm just
saying that you should have been as proud as a peacock when you left
the FCC office. And I'm sure you were!

I can't even relate my elation at passing the General in 1956 when I
was still 11. And the examiner even complimented me on my code ability.
"Son, where did you learn the code?."

"Well, I've been a Novice almost a year now and I've had plenty of
practice."

>I wonder if anyone would have a schematic of the KAM All mode TNC.
>Need to know where the reset pins are.

From page 30 ("HARD RESET") of Version 2.85 of Kantronics' "KAM KPC-4 KPC-2400 KPC-2 KPC-1 INSTALLATION MANUAL" [with added stuff in square brackets from the "KPC-3 REFERENCE MANUAL, version 5.0" just to make this answer more complete]:
1) Remove the PC board from the case as outlined in the Assembly and Disassembly section, above.
2) Locate the Test/Normal jumper which is labeled NOR T (normal-test). Jumpers are appropriately labeled on the PC board. Refer to the parts location diagram for help in locating them.
KAM Jumper K6
KPC-1 Jumper K1
KPC-2 Jumper K3
[KPC-3 Jumper J7]
KPC-4 Jumper K7
KPC-2400 Jumper K3

Looking in the manual at the parts-placement "photo" between the "KAM Parts List" and "KAM HF MODEM" schematic pages (so this SHOULD be a "picture" of the KAM, but its only label is "KANTRONICS"!), with the connector end of the board closest to my body, I find a "T NORM" (NOT "NOR T"!) jumper labeled "K6" on the board edge adjacent to the BIGGEST IC (on the end farthest from the IC's notch).

3) Place the jumper in the test position
[Place the jumper on both pins]
4) Apply power to the TNC
5) Observe on the computer display (your terminal program must be set at 300 Baud):
EEPROM INIT OK [CHECKSUM OK]
CHECKSUM OK [RAM OK xxxK BYTES]
RAM OK XXXXX BYTES [CLOCK NOT PRESENT]
REPLACE TEST JUMPER [REPLACE TEST JUMPER]

Some TNCs will not display the REPLACE message.

If you have removed the 2404 EEPROM from your unit for any reason, the EEPROM INIT message will read:
EEPROM INIT ERROR
This is a normal indication and does not indicate a failure with your TNC.
6) Turn power off. Do not keep the TNC power on for more than a minute or the regulator will overheat.

7) Return Test/Normal jumper to the normal position
[Return jumper J7 to the normal position (one pin only).]
8) Reassemble the TNC and return to operation.

Hope this helps.

769. Equalizing resistors needed for HV diode string?

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-02-05 19:28:24 UTC
From: "John, N9JG" <john@gotwals.XremoveY.com>
Message-ID: <slsFf.535480$084.208684@attbi_s22>
Source record: 13619

Recently I have replaced the HV capacitor and diode strings in my L-4B. In addition to replacing the caps, the original equalizing resistors across the caps were each replaced with 100K, 2 watt ceramic composition resistors.

The original HV diode string along with its equalizing bridge resistors were removed. The original diodes were replaced with 1N5408 diodes, but following a source (which I can no longer locate) I did not replace the equalizing resistors. The source had stated that modern diodes do not require the diodes to be bridged with equalizing resistors.

The work was performed in August, 2005, and the amplifier has been working fine ever since. But I have this nagging feeling that the diodes do need to be bridged. Should I add equalizing resistors, or are my fears groundless?

John, N9JG

No need to use the equalizing resistors. Modern diodes will "zener"
when reverse biased beyond their rated PIV. This will distribute the
inverse voltage across all the diodes. Just be sure to use enough
diodes in the string.

Best Regards,

Ed

I agree with Ed. Older diodes would breakdown, modern diodes
will "Zener" and basically self protect in a series string.

Pete

773. recapping Hallicrafters S-38B question

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-02-05 21:09:09 UTC
From: "johnrapp@bellsouth.net" <johnrapp@bellsouth.net>
Message-ID: <1139173749.276340.46280@o13g2000cwo.googlegroups.com>
Source record: 13623

I purchased a Hallicrafters S-38B on ebay for $40. The seller said it still worked, and he was right. Hooked it up to about 10 feet of wire and could pick up stations on all bands.

I have been reading a lot on antique radio restoration and S-38 restoration before I do any recapping.

The R17 330 ohm resistor is fried completely in half. No problem fixing that.

But replacing the two line to ground capacitors C27 .02 mfd, 600v and C26, 400v.1 mfd (it says mfo on the schematic, but that must be a misprint). I figure these are the line to ground capacitors, since they are the only two on the schematic going from both lines to ground.

I plan to replace the power cord with a bladed one. I plan to replace C26 & C27 with Y2 safety capacitors. But cannot seem to find any at 400 and 600 volts. The ones I can find are just 250 volts.

I must be missing something about the solution.

I really don't want to put in an isolation transformer.

Any help you can give me on replacing C26 and C27 will be most appreciated.

Also I have about 45 feet of space in my two story home's attic. Any recommendations on a good DX antenna?

Thanks for your time.

John

If those 250 volt replacement caps are sold as "safety caps", they
should be excellent. They are rated to handle any normal surges from
the AC power line.

If your antenna must be inside the attic, just run a wire all the way
from one end to the other and bring one end down to your S-38.

Others may suggest a type of loop antenna. Thousands of S-38's have
been used sucessfully with single wire antennas.

Good DXing.
John

John

The wide blade (neutral) should be tied to the chassis side of the AC line.
The AC switch (if it isn't wired this way already) should be wired to open
the
hot side of the AC leg.

Tie the ground wire to the case. Make sure the cabinet to chassis insulators
are in good condition--you don't want to have the neutral and ground leads
tied together at the equipment!

If R17 is open: that was probably caused by a defective rectifier (pins 3-7
on the filament tap open). Check the rectifier for an open filament on the
6 pilot lamp section.

justradios.com out of Canada has an extensive line of AC rated caps.

The 250 volts on the Y2 caps is an AC voltage rating. The 400 or 600 on
the old caps is a DC voltage rating. They are generally good for about
250 vac as well but if you're buying, you might as well buy the AC rated
ones.

Yes, and equalizing resistors can actually be a very bad thing, as they drift with age, heating and high voltage. They can end up dividing the voltage unevenly, which is exactly the worst thing to do.

In my day it was not only common to use equalizing resistors across each diode, but a .01 disc ceramic as well.

12 or 15 years ago, I built a 1KV .5 amp supply and as I recall, used 560K 1/2 watt resistors and .01 uf 1KV caps across each 1N4007. And a "soft-start" relay in the primary of the HV transformer.

I am 59, but I was 39 when I got my first BA , an R-390A . And an SWL from about age 9. Come to think of it, I did pick up an R1155 at age 19 which served me for many years.

Now, with 30-40 BA's, I think there are a couple of parameters that tends to bracket the age group (with notable exceptions): You gotta have some spare money (kids moved out?) , you gotta have some room (do.) , but also you gotta be able to do the heavy lifting. Maybe there is also the YL/XYL factor, when did we last hear about someone scoring on the strength of their BA-collection? "Won't you come up and see my boatanchors?"

Best,

Clemens S.Ostergaard

> each diode, but a .01 disc ceramic as well.

In the olden days, silicon diodes were very expensive, and had process variations that made individual diodes in a production run quite different from each other. The original 1N400X series was a grading process. The manufacturer attempted to make nothing but 1N4007's, but that didn't always work out. The really bad diodes became 1N4001's, and the really good diodes became 1N4007's.

[Just for grins, I just took a modern manufacture 1N4001, a diode rated for 50 PIV use, and hooked it up to my 577/177 curve tracer, and I saw no significant reverse leakage current all the way out to 1600V.]

The equalization resistors were used with the thought that they would swamp the leakage current of the diodes in the reverse biased condition, and make sure that each diode saw only its equal share of voltage. The truth of the matter is the reverse leakage current will start to rise rapidly when the diode starts entering its avalanche region, and the next leakiest diode in the string will start to take over when the leakiest one starts thinking about avalanching. The string balances, and protects, itself.

I guess I should have done a bit more research before I posted my question. According to the 2005 ARRL Handbook (page 17.9) "shunting resistors are generally not needed across diodes in series rectifier strings. In fact, shunt resistors can actually create problems because they can produce a low-impedance source of damaging current to any diode that may have reached avalanche potential."

It appears as if the Handbook agrees with you.

Please be aware of that fact that high voltage multi-junction diodes for microwave ovens are available for next to nothing and can be a good substitute for long diode strings with a single element.

This isn't exactly a pleasant subject but I am interested if anyone has any suggestions of organization that are interested in complete boatanchors estates. I have contacted one organization which is very selective and I believe if someone is generous enough to put in their will that they will bequeeth their whole ham station to an organization there should at least be a little enthusiasm on the part of the organization. Does anyone know of any good causes to whom a person can donate his prized equipment, QSLs, tools etc etc where it will be treasured and appreciated after I am gone?

I would expect than other than other individuals there is no
organization that would know what the stuff is. I believe you had better
sell it before you depart which will probably but them in good homes for
at least a while.

It seems to be that libraries throw books away, museums auctioned stuff
off or keep stuff in buildings that leak or basements that are full of
mildew so that is left?

Now THAT's a good idea! Any idea how to test USED ones?

On my morning school-bus route, I see about one discarded microwave oven
per month, and if they're not too far from the bus-barn, I return later,
"liberate" them from the "sidewalk store" and tear them apart for their
super-strong magnets which my grandkids really enjoy. But I've also been
saving the transformers, diodes, fans, and capacitors, with the ultimate
goal of making a high-voltage power supply for a homebrew amplifier. So,
without any high-tech equipment, how might those diodes be tested?

Another problem: I went to look at a deceased ham's station that the widow wanted to get rid of and somehow the widow, who didn't know much about the value of used gear but could look up stuff in a recent QST, thought that the "package" (including peripheral stuff) she wanted to sell was for full list price new (even for gear that was 20+ years old). No, we're not talking about Collins or rare Halicrafters, either. And, she told me "Well, I'm not going to give it away" when I offered what it was worth to me (and I only wanted a small fraction of it, and not that badly either). And, I didn't even begin to explain about why I might want to have to take some time to _test_ the stuff to my own satisfaction or that you don't sell used cars at new car prices. And, I'd want a test drive, too.

Those transformers had magnetic shunts that limited the current they can deliver. There's been some discussion about using them in the ham press over the past several years. I think the inagural issue of Communications Quarterly covered it in some detail. You'll probably have to do some simple mechanical mods to the power transformers.

In all seriousness, I remember on fellow in Ohio who was getting up in years.
He tried to donate his gear (mostly all pre war equipment) to the AWA and another organization.
The AWA is literally ursting at the seams with similar gear. There truly is just that much of it still around.

The other organization in New York posing as a charity school but in reality is a scam - I learned this by talking to the organizer of this con as he leaned bach on his Jaguar - no kidding. He described how the gear is donated and sold to raise money for other projects very little has anything to do with radio.

Anyways, I was lucky enough to be given this equipment. I cherish and use as much of it as I can today. There is still at least one big transmitter the I will be restoring. But the parts and books have been very handy to me.

It was sort of an inheritence in reverse. I got the 'goodies' up front and also got a great friendship with the OM and his XYL.
It was great to have grandparents again albeit adopted ones.
I was glad to help them out with things they needed around the house.
It is utterly amazing how much we take for granted that an elderly person cannot lift or do.

Lots of nice memories and gosh awful instant coffee with lunch. HI

Our friendship lasted for over five years before he passed. I learned so much about history, life and even investing in the stock market from my Elmer.

That was over 10 years ago. I was in my early thirties, It seems like yesterday.

So my point is that if you can find the right person and the situation is right, things can work out well.

In the end we just die and our belongings is only stuff whose worth is in the eye of the beholder.

I have reached the point to where I am ridding myself of stuff that the heirs would throw in the dumpster. I have sold or given to a good home most of my boat anchors and what is left, I will get rid of after making sure they are functional. If not then I will advertise them as parts. Some projects that are no longer important, have gone away.

Interest may have been started at the age of 3 when I bit into an extension cord. Life altering event.

Long story for another day about how I got into ham radio, getting my ticket in 67.

was an SWL for about 4 years and when I began to experiment with AC convinced a local kid to hold different combinations of power cords until I could see how he got "shocked" so I would not repeat his actions. When he did get a shock he jumped so fast I was unable to note how he was holding the wires.
Spent next 4 hours in my room alone per my mother

Woke my parents up at 6 AM one Sunday morning in 65 to tell them of my invention of AM stereo. Dreams of fame, $$$$, appearance on "What's My Line" and my picture on cover of PE, Boys Life and Look magazine filled my head. Later learned that stereo and 2 speakers in parallel are different concepts.

53 here too and still dreaming of fame, $$$$, appearance on "What's My Line" and my picture on cover of PE, Boys Life and Look magazine .

Rarely does a museum really need some piece of equipment. A donation means storing it somewhere and then ultimately disposing of it under less than ideal circumstances.

If you need a write off, then give it to a charitable organization that is geared up to sell it on eBay to the highest bidder. That will assure that it will be properly displayed and revered. If you do not need the money, give it to someone who will appreciate it. Do so while you are still alive to avoid having a family member overwhelmed with a pile of what they consider junk.

I had aggressive cancer 10 years ago. Sold most of the stuff to a friend and retained visitation rights. Kept a few things. Then, I fully recovered. It took me almost 5 years to accumulate as much or more than I had the first time around.

Hi,

I have several young boys in the 8-12 age range who need an activity to help them get focused on something so they will take a better interest in school.

My thoughts are giving them an inexpensive battery operated digital radio with the shortwave bands and a book on short wave listening and amateur radio.

Which would be the best used sw digitals to buy that would be decent enough to pull in the other countries?

Thanks,

John

Do you have the other sets of coils? I have the Meissner instruction
manual from 1943 that covers al ot of different projects including
the signal shifter. I can make copies of it for you. However, it does
not include coil winding data. Heh, apparently they want you to buy
thier coils instead of making your own.

That being said, the 160 meter range coils are from 1.600 to 1.870 KHz
and are resonanted with two variable capacitors. Neither of which have
a posted value either.

Hopefully, you have a setof exsisting coils and reverse engineer from
there with the turns ratio and total number of turns.

I'm aware of (and have done) the transformer mods, but what I'm asking
now is

"without any high-tech equipment (beyond the usual ham stuff such as
resistors, VOM, etc.) how might those diodes be tested?"

Donating a lifetime collection on the condition that it will all be kept together seems rather unlikely to me. Not impossible, but there are very, very few old-radio museums in the world, and most already have more "stuff" than they can ever exhibit.

Have you tried contacting nearby radio collector clubs? You may meet someone who would appreciate what you've got. One club list is available at http://www.antiqueradio.com/clublist.html (no connection to me).

If you can't find anyone to take the whole shebang, and you aren't interested in eBaying on your own, perhaps you could find a local broker to sell everything on eBay for a commission. Selling piece-by-piece will get you much more than trying to sell an entire collection in one lot.

I have already resigned myself to the idea that if I kick tomorrow, my "treasures" will probably be hauled away by the nearest charity truck. If you donate to a pick-up charity, at least you could take a modest tax writeoff.

Some thoughts...

Any of the little 'Chinese' portables will pull in other countries. The cheapest ones tend to suffer from overloading, may not have full frequency coverage other than shortwave broadcast, etc, etc.

But, for well under $100 (more like 60-80) you can get full coverage, a decent dual conversion receiver and BFO to tune sideband and CW, etc, etc. For exposure to amateur radio they need a BFO.

For myself, I'd personally buy one of the NEW Chinese digitals like the no-name DE110* series or Kaito KA1102, etc. (I can't believe I'm saying that). Thats probably overkill for kids of that age.

In these little sets you basically get what you pay for and the price reflects that. The $15 ones 'work' just fine for a kid who has never heard shortwave radio before.

I can't think of a common USED digital model that has SSB capability in the same price range. Browse the Shortwave category on ebay to get a handle on whats out there these days.

The other side of the coin would be an old tube receiver. You can get a decent Hallicrafters S-40 (including shipping) in the same price range. I *should* recommend the venerable S-38 but they tend to carry a

"collector" price tag. Some kids are impressed with old gear, some are totally turned off by it.

Good luck to you!

-Bill

Its tragic that lots of XYLs have to deal with this problem, but I also heard (many years ago) that places like The Smithsonian get tons of donations that they cannot use and I'm talking about very large quantities. It is possible that they may even be refusing to take stuff unless arrangements can be made ahead of time.

I've told my wife she needs to just get rid of the stuff and not worry about price. I hope to figure out some simplifying procedure or work out some arrangement. However, I recall that there are "junk haulers" who will come and take the stuff away for free and they worry about getting what they can out of it to pay their wages/costs and I don't remember, just now, the names of them but some are on the WWW.

It might be worth it for some business-orriented ham(s) to organize a collection function along with a auction (eg. eBay) and pay for it with the proceeds of the auction and (maybe) some kind of profit sharing with the widow. However, I've seen "widow" tables at hamfests where they almost gave stuff away or they tried to get new or almost new prices for stuff

that needed to be priced to sell, not priced so it would never sell.

809. Help with CRF-230

Newsgroup: rec.radio.amateur.boatanchors

A call for assistance -- I picked up a very nice CRF-230
a few weeks ago, and was waiting for the AC cord (which
I finally obtained on Ebay -- thanks for those who responded
to my early inquiries).

It's a beautiful radio -- probably one of the best looking
things I have ever set eyes on. And it's completely
working on all bands.

But it has the following issues:

-- Very dirty contacts (was owned by a pipe smoker)

-- And two bulbs out on the display

Appreciate any advice (or offer of help) from any 230 owners
in the group as to best way to go about cleaning the radio,
what cleaner to use (or avoid), and the bulb issue.

This is the 230 not 230B by the way...

Thanks

> ================================

Well, first, you have to ask yourself, "what does a diode do?", and next you have to ask yourself, "what is special about these diodes?" After you answer these little questions, the answer to your big question should be obvious.

In case it isn't, a diode is a one way valve for current, so you need a source of current to test a diode. And second, these diodes are stacks of diode wafers in series, so they have many forward conduction diode voltage drops when current passes from anode to cathode.

A 9V battery, a 1K resistor, and a DVM set to measure DC volts across the diode would do. Put the 1K resistor in series with the "+" terminal of the 9V battery, and connect the other end of the 1K resistor to the anode (unbanded end) of the diode, and connect the cathode (banded end) to the "-" terminal of the battery. The DVM should show several volts across the diode in this position. If you divide this voltage by 0.6V, and round down to the nearest whole number, you will get the number of diode wafers in the rectifier. Now, reverse the battery, and you should see 9V on the DVM.

If you happen upon a really HV rectifier, use 2, or more, 9V batteries.

Now, the big question that comes to my mind: If you can't figure out how to test a diode, should you really be mucking around with a power supply that can kill you 10 times over? I'm thinking, no... But as always, it is something for you, and your widow to be, to decide.

-Chuck

"without any high-tech equipment (beyond the usual ham stuff such as resistors, VOM, etc.) how might those diodes be tested?"

You need to build a hi-pot tester. Schematics are found using a search engine. Basically, you take a high voltage dc and connect it through a very high resistance and a microammeter to the device to be tested. Then, you crank up the variac to see when the device fails. Current will be limited so you will not damage it.

You can use one of your discarded microwave units for the voltage source, which means that you will be looking for a variac and a couple of low current meters along the road to complete your test equipment wish list.

Find a younger ham that will take control of all the equipment and liquidate it when the time comes. I have been doing that for years. I sell the stuff at hamfests or eBay and do not even charge a commission. I keep what does not sell .

A funny true story happened to me. A few years ago I got a call from a friend's wife. He was elderly and over a few months he had been going to lunch and never making it, ending up in nearby towns. At one point he was almost vegetative. His Dr's diagnosed him as Alzheimers and told his wife he would never recover. She called me and asked that I liquidate a building full of old radio and test equipment.

I went to work and sold some to friends, some on eBay and some at a local swap meet. I just collected the funds until after the swap meet. There were a few things that did not sell at the swap meet, so I figured I was done selling. I called the woman to report my success and she said "just a minute, here is Henry". There was my friend on the other end of the telephone, home and alert. My heart sank. I had to report that I had sold his entire collection of stuff. It was the lowest point of my life. I felt like I had drained the blood from him. But, the rest of the story made for an ok ending. After I told him I had sold all of his equipment, he told me that even though he was home, he was not up to enjoying it and he never would be, so that it was still fine that I had liquidated his stuff. However, he said there were two things he wished he still had and those were two of the three items I could not sell. He was delighted and I felt like the luckiest guy alive.

He died about a year later, but we already had liquidated his gear.

I think this situation is somewhat similar to what I encountered a
couple of years ago. At my place of employment we upgraded several
programmable controllers. I called the local school to see if they
wanted the older, (but not quite obsolete) equipment for their
technical program. THeir reply stated Yes , but we will expect you
to supply service and support for this equipment.
Needless to say it was the dumpster for that stuff.

I have a good friend who is a decent and honest man.
He feeds his family buying and selling old technology,
including ham radio stuff. I gave his name and number to
my wife and told her that he would be fair to her,
and he will. This idea that goes around that
anyone who deals in ham radio equipment is somehow
"tainted" is just envy with a cheap coat of fake moral
paint slapped over it.

Pointed subject, to be sure. First, let me say I found the comment by one person about that NY "radio club" charity. I've always wondered what it really was.

But to my point... I'm fortunate in that my XYL is quite a bit younger than I am and she's been around when I've "accumulated" the current crop of equipment. Sure, I had a shack before she arrived on the scene, but the plethora of BA's I now have arrived post-XYL. She has an abiding knowledge of what the stuff is and what I originally paid for it (that, and I have a running inventory). I'm currently divesting some treasures owing to an impending move. But, most gear will make the trip. When the time eventually comes, she will sell the gear for what it will bring, hopefully with some allied support from trusted friends. I cannot expect her, or anyone, to interview the buyer to confirm their good intentions for the gear. All I can hope for is that it won't go to predatory ambulance chasers of the ilk we all know so well. Beyond that, I will have considered myself a good steward of these "maritime location securing devices" and will have passed them on in better condition than received. I will have had fun and done my part. That's all folks!!

Thanks Colin. As is so often the case, your comments make more sense than most on this newsgroup. I should have figured that I could expect vacuous suggestions ("Did you ever think of donating to a radio club? Duh") and sarcasm not to mention the tedious stand-uyp comics (who should keep their day jobs). Jeeesh...I am NOT giving the stuff away now (hopefully I've got a lot of years left).. Nor am I interested in walking away with any money from it. Nor am I interested in one entity getting it all. I just am interested in the stuff being received by someone who will appreciate it. As for those vultures who fly around widows trying to peck them clean, I am all too aware of that situation. We as hams don't have very clean hands in that respect. We've all seen it.My whole reason for putting this posting out is to plan for something instead of my executor landfilling my good stuff. I think I am going to go about this another way because, other than your comments, most others were worthless.

In spite of your attitude, I would like to put in a couple of points: we are
engaged in a hobby that is rather unique. The stuff we see as valuable, most
everyone else in the world sees as trash. It's a shame, but that is the way
it is. If you are at all like me, the value you see in a piece is largely
a result of nostalgia.

In the first place, once you die, it isn't going to make any difference
to you what happens to your material possessions. It should make some
difference to you, before you die, knowing the degree of a mess you will be
leaving behind for your spouse and heirs to clean up.

About all you can do, is try and not accumulate trash, and to leave some
instructions to your executor that itemize the major pieces of your collection,
and assigns each piece a realistic value. Your instructions should
suggest how to find likely customers for your collection, and perhaps
even give the task of disposal to some willing friend.

And if all your good stuff ends up in the landfill, then perhaps, it
will join you in the afterlife. (eg. you can rot together ;-)

-Chuck (who will be leaving behind quite a mess!)

I am president of the Carolinas Chapter of the Antique Wireless Association.
One of the services our club provides to our members and their families
is the auctioning of estate collections at our annual conference in
Charlotte NC.

We have done a number of these over the years and so far we've
gotten several times what the family thought the junque was worth.

Last year there was so much stuff in the collection that we had to have
2 auctions. It took all day for seven people to load the collection
in a 30 foot race car trailer and then haul it 5 hours and unload it
in a warehouse. We then spent many, many hours cataloging
the collection for the auction and bagging small items in zip lock bags.
We then loaded it all in a u haul truck and unloaded it at the Sheraton.
At the time the club only charged 5% auction fee.
That's not much for all that work. It's 10% now.

An auction at a radio meet is by far the best way to dispose of items
like this. You may have to haul it to the site, but there's no shipping
or packing involved. And it's at an event where poeple have
pockets full of money and are looking for radios to buy.

Unless it's really rare, early gear, most museums are not going to want
it. The best thing is to get it in the hands of those that do.

Ron has a good idea if the club knows about the equipment. Unfortunately, many ham clubs are comprised of appliance operators who do not know the value nor care about the older stuff.

One problem I have found is that a few hams have taken the time to write down values of equipment. But, if they do not know what they are doing, it can be a giant disappointment. I have seen in one case where an elderly ham got some prices from friends, who got it off eBay. The problem was that his stuff had sat in a moist garage and was rusty, while the pieces were valued at what a pristine and restored piece had sold for. If you are going to price it, make sure it is realistic values.

Not long ago, I recall someone purchased a beautiful SX-88 on eBay for about $5,000. The purchaser wanted one and could afford it. Unfortunately, people see that and assume their ordinary and unrestored SX-88 is worth $5,000. I bought an SX-88 that had broken dials, rusty case and neede a lot of TLC. It was on the other end of the spectrum. If I did not spend so much time on the internet, I could have it restored by now.

I am building a vacation home for the express purpose of sneaking a personal radio museum next to it. My plan is to store each radio, with all of the accessories and manuals together in their appropriate display area. One of the big problems I have when assisting in estates is finding power supplies, manuals, microphones and other items. Cannot tell you how many rotators I have sold without control boxes, because the family threw away the control box.

Another sad story that still haunts me is when the father of a friend died with his ham gear in the basement. I valued it for estate tax purposes and sold much of it. However, there were 3 items I wanted to buy and so I left them with my friend and told him I would determine a fair price and buy them. He wanted to give them to me. They were an Elmac AF-67, new in the box, and two new gold Vibroplexes. I spent about a week deternining how much they were worth and went back to buy them. Alas, all three had been tossed in the dumpster.

Now, I take the stuff first and argue about price later.

I have a manual for the Wilson T-1402SM VHF portable transceiver. It needs a new home. Is there someone who collects these old manuals and then makes them available? I would donate it to them. BAMA does not seem to want this sort of stuff.

I thought we were talking about Boatanchor gear, not general everyday
ham equipment...
The idea for the auction wasn't about the local 2 meter ham operator
club. BAs should go to a collector event. That's where the knowledgable
buyers are. A bunch of 2 meter comandos wouldn't know what to do
with a BA.

Colin, I am in the process of scanning all my old manuals, and listing them on my website. I upload the scan to another website so someone can access it on request, since I can't afford a lot of web space. I also plan to make full CDROMS available for a couple bucks each, because some of the manuals are huge. They will be sorted into categories, or custom made to what an individual wants. I straighten the scans, splice the schematics together, and clean up the stray dots, so I spend a lot of time on each manual. I am a disabled veteran, and this is more of a project to keep me busy, than anything else. Most of my useful hours are spent on this project:

http://home.earthlink.net/~computersforvets/ A project to provide free computers to disabled and disadvantaged Veterans in Marion County, Florida.
computersforvets@earthlink.net

which will get any money made from selling CDROMs, if there is anything in excess of the cost of the media and shipping. I can't just sit around and do nothing, so I started the "Computers for Veterans" project. I have a small but steady stream of donated computers and parts coming in. I repair as many as I can and turn them over to the local "Vets Helping Vets" group. I have funded the overhead out of my disability pension, but I can't afford to buy replacement boards and such. The gasoline costs are killing me. I can't ask for, or accept any cash donations until I get my tax exempt status from the IRS, so I fix what I can without buying parts.

I am not a ham, but I have collected and restored boatanchors from the mid '60s, and I worked as a broadcast engineer at a number of rado and TV stations so I know the value of preserving manuals on all types of electronics.

That's buy it now price (if your really nuts) - bid is only $280 - it's worth about $800

It's in pretty good shape - most worn units have the PLATE - GRID lettering below the meter partially worn off.

Pretty expensive for a CW ONLY xmitr - Consider that J Viking only made 800 of these and they never did sell very many of them.

A better rig would be the Drake 2NT, Heath DX-60B or a even a KNIGHT T-60 xmitr - No built in VFO but XTALS are kinda fun and they are pretty cheap even on eBay.

I agree. I've watched these auctions for a few items. I guess there are people out there with money coming out of their ears and don't care what a fair price is and get "the fever" that they _have to_ have the thing.

Or, the shill system is the new way to make money.

All this made me make the decision to just go totally for building all homebrew gear, in my present retirement, for my station for the future. And, if I don't like the price at the hamfest, I'll just pass the stuff by.

We should not single ourselves out. How many people spend tons of money on
antique-junk cars? Hunting guns, stamp collections, and all manner of
other hobbies. They all have to deal with their collections.

I have reluctantly decided to part with my trusty old Racal RA 17C-12. It is in good operating condition. Cosmetic condition is good, with all original knobs. The S-meter is not original. This is a great radio and fun to use. The bandspread is incredible, with about nine feet of 35 mm firm scale per mHz.. This is a very heavy radio. I bought this from a guy in England a few years ago and it was shipped to the US in a wooden crate.

I thought I would check to see if anybody near Oklahoma City would like to buy it and come get it before putting it on the "big board in the sky". I would
even drive it an hour or two away to meet you, if interested.

I have a JPEG of it, if you would like to see it.

I am asking $450 for it.

Well and good but someone has to "manage" it. Their 'compensation' may
come as being the guy who has first pick.

In my case, if I keel over tomorrow, the XYL knows who to call to help
get rid of my stuff. If Guy A doesn't want to mess with it she also
knows Guy B.

Anybody who has a houseload of radio junk and a family should have a
clue given as to how to unload the stuff. Thats what friends are for.
Same as if you have a dozen St. Bernard puppies@!

Pick your best radio friend and hope he doesn't die before you.

Source record: 13696

I have a pair of working solid state replacements for the 866/A and 3B28 rectifiers. Rated, 10,000 volts at 3/4 amp. 5" high, 4-pin, ready to plug in. I have seen these go for $65.00/each, but will sell both for $25.00 plus shipping. These are almost a must have for the Collins 30S-1. Take the load of that tranny, install these.

Those little crystal-controlled Novice rigs are a ball to use,
aren't they? If you aren't lucky enough to have some crystals,
a good rig to look for is the Knight T-150 otr T-150A. It has
a pair of 6146's in the PA, built-in VFO, CW and AM, 80m - 6m.
You can buy a nice one off eBay for $100 - $125.

I'm not sure why anyone other than a collector would spend that
much on a Navigator. Why not just buy a Ranger for $250 or so?

I bet that there is someone out there with more money than brains, though. If it was MINT condition, all restored, etc, it MIGHT be worth $500-700, due to scarcity, but the auction even states it is not in mint condition. Worth about $250-350, again, only because of scarcity.

854. Drake TR-3 9.000 MHz crystal?

Hi Brian, I sure wish I had a receiver that the USS North Carolina needed,
I would be proud to give it to them.
I haven't been on board for nearly 30 years, but I have fond
memories of the ship. I was in the 4th grade in 1961/1962 when
a group of residents started the campaign to bring her home for
display in Wilmington.
They asked all the school children in NC to donate $.10 (tem cents)
to the project, everyone that made the donation got a free pass to visit
the ship.
It must have been about 1964 or '65 before we got to go, it was fun
being able to go with my dad since he served on the USS Alabama
during WW2 and could really give a "I was there tour".

I'm looking forward to getting the chance to go back soon.

73, Ron

All,

Yesterday I had the opportunity to tour the battleship USS North Carolina yesterday (Wilmington NC) with a special tour of Radio Room One from the onsite electronics tech, Terry Kuhn...

Onboard are the ship's original RAK/RALs, RBA/RBB/RBCs and transmitters, panoramic adapters, etc etc...as things were left in 1947 when the ship was decomissioned.....

The USS North Carolina is looking for a RAA and RAB (purchase, tax donation, etc)... please contact:

Terry Kuhn (not a ham but should be!)
etkfixr@bellsouth.net
His phone-ship: 910-251-5797 ext 2035

thanks and regards,

868. FS: Equipment Manuals

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-02-10 21:05:43 UTC
From: Peter Hiscocks <phiscock@job.ee.ryerson.ca>
Message-ID: <dsiv77$f70$2@news.ryerson.ca>
Source record: 13716

The following manuals were rescued from the trash at my university during a move. I've given away some to interested parties, these manuals remain. I'm selling them to ensure that they get a proper home. Cost $2 each plus shipping. Check with me by email to get the shipping cost, which ranges between $7USD and $12, depending on the size of the manual.

All the manuals are in excellent condition with very few (if any) marks.

Email me if you are interested in any of the following manuals:

Tek 3B3 Vertical Amp Plugin
Tek 561B Scope Mainframe
Tek 545B Oscilloscope
Tek 7623 Storage Oscilloscope
Tek 53/54D Vertical Diff Amp Plugin
Genrad 1650A Bridge

These ones are currently listed on Ebay for $2 plus shipping.

Tek 3A74 4 Channel Vertical Amp Plugin
Tek 564B Storage Scope Mainframe
Tek 2B67 Timebase Plugin
Tek 321 Oscillosope
Tek 3A74 Vertical Plugin
Tek 3A8 Op Amp Plugin
Tek 3C66 Carrier Amplifier Plugin
Tek 434 Oscilloscope
Tek 5031 Oscilloscope
Heathkit O-11 Oscilloscope
HP 180A/AR Scope Mainframe
DuMont 224A Oscilloscope
DuMont 304A Oscilloscope

The DuMont manuals will be of interest to oscilloscope history buffs, they are from the 40's and 50's.

I have another box full of manuals, which I'll post in due course.

Thanks -
Peter

Gawd, I hate to admit it, but AES seems to win with tube boxes. I've
bought ones from Radiodaze but they don't have all the 'correct' sizes
and they seem a tad on the 'cheap' side the way they fold, etc.
Of course you could use spark plug boxes and such....

I find that an initial investment in real boxes that fit my tubes and
stack right is soon forgotten when I find my stuff reaching some
semblance of order. If I had 150,000 ersatz tubes I'd probably store
them loose in beer boxes for economy :) But I'm also only dealing with
a few hundred keepers so the boxes work for me even at ~25 cents a whack.

-Bill

I use the ones from Antique Elec. Supply. Some of the others have poor size selection. One thing about the Antique 7/9 pin miniature boxes, the end flaps are not cut for easy insertion. But, they will go in OK if you roll them over a flat surface when closing each end.

I hate to get "political" and I realize this is - NOT - the place for this sort of thing....

However, sometimes you have to stop, pick up your head from the undersides of a radio and say "Huh?", "What da #$%@*....?"

Read the following very carefully and see if you can find a potential problem ... read the end part for a good laff....

Again my apologies... I laughed so hard I had coffee coming out my nose...

-WDï¿½HCO

WASHINGTON - A company in the United Arab Emirates is poised to take over significant operations at six American ports as part of a corporate sale, leaving a country with ties to the Sept. 11 hijackers with influence over a maritime industry considered vulnerable to terrorism.
ADVERTISEMENT

The Bush administration considers the UAE an important ally in the fight against terrorism since the suicide hijackings and is not objecting to Dubai Ports World's purchase of London-based Peninsular and Oriental Steam Navigation Co.

The $6.8 billion sale is expected to be approved Monday. The British company is the fourth largest ports company in the world and its sale would affect commercial U.S. port operations in New York, New Jersey, Baltimore, New Orleans, Miami and Philadelphia.

DP World said it won approval from a secretive U.S. government panel that considers security risks of foreign companies buying or investing in American industry.

The U.S. Committee on Foreign Investment in the United States "thoroughly reviewed the potential transaction and concluded they had no objection," the company said in a statement to The Associated Press.

The committee earlier agreed to consider concerns about the deal as expressed by a Miami-based company, Eller & Co., according to Eller's lawyer, Michael Kreitzer. Eller is a business partner with the British shipping giant but was not in the running to buy the ports company.

The committee, which could have recommended that President Bush block the purchase, includes representatives from the departments of Treasury, Defense, Justice, Commerce, State and Homeland Security.

The State Department describes the UAE as a vital partner in the fight against terrorism. But the UAE, a loose federation of seven emirates on the

Saudi peninsula, was an important operational and financial base for the hijackers who carried out the attacks against New York and Washington, the FBI concluded.

Sen. Charles Schumer (news, bio, voting record), a Democrat whose district includes the New York port, urged the administration to consider the sale carefully.

"America's busiest ports are vital to our economy and to the international economy, and that is why they remain top terrorist targets," Schumer said. "Just as we would not outsource military operations or law enforcement duties, we should be very careful before we outsource such sensitive homeland security duties."

Last month, the White House appointed a senior DP World executive, David C. Sanborn of Virginia, to be the new administrator of the Maritime Administration of the Transportation Department. Sanborn worked as DP World's director of operations for Europe and Latin America.

Critics of the proposed purchase said a port operator complicit in smuggling or terrorism could manipulate manifests and other records to frustrate Homeland Security's already limited scrutiny of shipping containers and slip contraband past U.S. Customs inspectors.

"When you have a foreign government involved, you are injecting foreign national interests," Kreitzer said. "A country that may be a friend of ours today may not be on the same side tomorrow. You don't know in advance what the politics of that country will be in the future."

Shipping experts noted that many of the world's largest port companies are not based in the U.S., and they pointed to DP World's strong economic interest in operating ports securely and efficiently.

"Does this pose a national security risk? I think that's pushing the envelope," said Stephen E. Flynn, who studies maritime security at the New York-based Council on Foreign Relations. "It's not impossible to imagine one could develop an internal conspiracy, but I'd have to assign it a very low probability."

Changing management over the U.S. ports "doesn't offer al-Qaida any opportunities it doesn't have now," said James Lewis, who worked with the U.S. committee at the State and Commerce departments. "It's in Dubai's interest to make sure this runs well. There is strong economic incentive to be sure these worries never materialize."

Flynn and others said even under foreign control, U.S. ports will continue to be run by unionized American employees. "You're not going have a bunch of UAE citizens working the docks," Flynn said. "They're longshoremen, vested in high-paying jobs. Most of them are Archie Bunker-kind of Americans."

Peninsular and Oriental and DP World set approval by the U.S. security committee as a condition for the sale. In regulatory papers, the companies said either the committee must agree not to formally investigate the

purchase or Bush must not move to block the sale for national security purposes.

Since the Sept. 11 attacks, the FBI has said the money for the strikes was transferred to the hijackers primarily through the UAE's banking system, and much of the operational planning for the attacks took place inside the UAE.

Many of the hijackers traveled to the U.S. through the UAE. Also, the hijacker who steered United Airlines flight into the World Trade Center's south tower, Marwan al-Shehhi, was born in the UAE.

After the attacks, U.S. Treasury Department officials complained about a lack of cooperation by the UAE and other Arab countries trying to track Osama bin Laden's bank accounts.

Well since I am boxing the loose tubes I have, guess I had better test them! I have a military I-177 Made by Daven that sez that the gm of the tubes is 3x higher than it should be. A 6K6 should be 1600 but I read 4200!!! Pins the needle on the 3000 range and reads 4200 on the 6000 range. All known good tubes tested read high. I do not see a pot or adjustable power resistor to change the calibration. Looked @ the calibration info on the Hickok 600 series, but is too different to apply to the I-177. Any ideas? Anyone have the calibration routine for the I-177? The mil manuals I have found do not have a calibration routine.

Thanks
Randy.

They are both 150 volt regulator tubes and either will work. The VR 150
MT is the Japanese designation.

I do not know which is the story of your tube tester. A possibility is that somone replaced the two wire-wound potentiometers with others of different values (it happened to me!). It is VERY difficult to find a replacement for them. One is a 3000-ohm potentiometer having a non-linear taper, the other one consists of two ganged low-value potentiomers. I would check them with an ohmeter before proceeding to isolate the fault.

150MT is a 150 volt cold cathode regulator tube. So is the OA2.
Dunno if the required series resistance is the same, but if the thing
is regulating properly I wouldn't worry.

899. Hamarlund HX50 crystal Oscilator Question

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-02-12 19:44:27 UTC
From: Paul P <paulREMOVE@REMOVEppinyotREMOVE.com>
Message-ID: <veMHf.2180$Fe.1311@trndny06>
Source record: 13549

During the alignment procedure I have found the crystal oscillators dead or off frequency (as in unable to adjust to spec with in 1khz). The crystals have a 1962 dates stamp on them. After disassembly, checking, replacing out of tolerance components and cleaning all of the associated 6AW8 passive components, I got most of the crystals back to oscillate. Only two would achieve spec frequency.

1- Is this common with old crystals? (Typical aging is 50ppm/yr. so 44 years times 50 ppm times 33.88mhz takes these crystals to where I am experiencing trouble.)
2- Should I expect to be replacing these to obtain accurate frequency and oscillation on the dead ones (10b and 10c meter bands)?
3- What crystal companies would you suggest I contact for reasonably priced third harmonic crystals?

Alignment/schematic at http://bama.edebris.com/manuals/hammarlu/hx50/.
Manual page number 31 (32 djvu). Step 7-6.

Am I tripping over rat turds here (except for the dead crystals)? What do you think?

Thanks,
Paul.

Some one on the Antiques Radio Group once suggested using the little yellow envelopes for change. I purchased a cheep box of 1000 and use them successfully. Once labeled they are placed in shoe boxes.

I find it an economical compromise for storage. And holding little parts too.

Paul

have
a companion receiver that it can slave to for transceive operation, a 1 kHz
error
is something I wouldn't worry about. Can the dial scale resolve a 1 kHz
difference?
If not, don't sweat it.

You could probably add a few trimmer caps to allow some pulling to get them
closer to spec.

BTW, International Cyrstal Manufacturing in OK City, OK is usually the
vendor
of choice for crystals.

Pete

902. FS or Trade Collins 32V-3

I have a very nice Collins 32V-3 transmitter with matching Shure T-3 microphone & stand, spare 4D32 and copy of manual. The mike is better than a 9 out of 10 and the transmitter is close to a 9 out 10 appearance and electrical. I'd like to trade them for a good older Martin dreadnought guitar in same condition or sell for the best offer over $1500.00 in deal where we can meet within a couple hours of Tulsa. Otherwise I'll eBay it but I hate the idea of packing it, it weighs 110 lbs. I also have a very nice 75A-4 but I'm haven't convinced myself to part with it.
tnx

I had this same issue with my HX-50A some 30+ years ago. I was kinda
'new' and after I fiddled with it unsuccessfully I took it to a guy who
knew what he was doing. He called me back later in the day to come
fetch it.
After all I'd been thru he made it sound so simple! I recall a little
slug tuned coil that is picky about adjustment on 10b and 90 and the
admonition to tune it to osc rather than struggling to match the xtal
freq. If its only a couple of kcs off don't fret it. The dial doesn't
have that much resolution anyway.

Hi,

I wouldn't worry much about the band setting crystals,
you only have a string dial with that rig, so you need
to spot with an accurate receiver if you get near the band edges anyway.

The important crystals are the USB and LSB carrier oscillator
crystals. If they are off frequency, your voice will either
sound thin or bassy.

There is an easy mod to almost elliminate the resting current
of the 6DQ5 during HX-50 standby periods.
The mod appeared in an early-sixties CQ magazine,
and is very worthwhile to reduce heat in the cabinet.

If you'd like, I'll send the info to you directly.

I might add to this. My rig, and mind you the xmtr was only about ten years old at the time, had suffered from some drift in the filter. I understand this was a common issue.

If memory serves the upper and lower filter frequencies are stamped on the filter itself and thats what you need to match the carrier oscillators to, not the actual crystal frequency. I believe manual explains how to do this and place the oscillators correctly on the skirt of the filter. Its pretty easy to do to get them matched to the filter...and if need be give them a tiny tweak while listening to the transmitted audio.

Hello ,thanks for your answer.I have no precise question,I have bought one on ebay ,it is electronically complete ,and without problem (maybe the chemical condensers to change),and mecanically the mecanism of tuning has been removed ,but not the variable condensers and coils.
I plan to do use it to do radio-astronomy ,yes it may seem a fool project ,but one part of my hobby besides radio-amateur is radio-astronomy ,and I wanted to use a receiver like they were at the beginning of radio-astronomy on vhf just to know what was received from the sun at that time .This is why I'd like to have the schematic with values of resistors ,condensers etc,and the connectors ,so I can use it and repair it .
Thanks very much,best 73 alain f1gqb

G'Day Alain

Ah memories - I used an SCR522 Rx & Tx on 2 metres way way back. They were a great piece of gear and used by lots of hams.

Before you apply power to the receiver (or transmitter) check out the .006mf mica HT bypass capacitors. Some of the sets used Micamold capacitors which are dark brown in colour and are in fact paper not mica. They used to break down with monotonous regularity.

Best to replace the lot (15 or so)in the receiver (and Tx). Some SCR522's had good mica capacitors and if I remember they were light brown in colour.

There were a couple of versions of the receiver that I know of. One version had a squelch relay whilst the other version had electronic squelch.

I do have a manual but to copy the circuit it would be in 3 pieces and I dont know how the small print would come out.Also have the wiring diagram.

There is a relative simple modification to make the RX tunable and not crystal controled

You should be able to get a circuit locally if you hunt around, if not let me know and will try sending you a copy.

Good luck with the project. I also used a 522 on 2 meters. As I recall, they were OK in their day, but pretty insensitive by today's standards. On the other hand, the sun is a pretty powerful transmitter! ;-)

Have you tried copying Jupiter? It's around 21 MHz; nice web site about it. Do a web search for "Project Jove".

Alain,
You might ask some of the older members of your local radio amateur community for information and drawings of the 522. It was a very popular set amongst hams in the post War years.

I am surprised that you will be attempting radio-astronomy work with the BC 624. As someone mentioned, it is not a very sensitive receiver. Most amateurs that used it began by rebuilding the front end for lower noise and higher gain. One chap mentioned substituting 6AG5 tubes for the 9003's. I used 6AK5's. It is a 4 channel crystal controlled unit and perhaps for your purpose, just a few channels may be acceptable.There are some simple changes that will allow it to be continuously tunable from 100 to 156 Mhz without having to use quartz crystals.

I'm sorry that I do not have ability to scan and forward information.

It might be of interest, when I was in the military, one of our search radars operated in the "S" band (around 3000 Mhz), and I found if I raised the antenna elevation and aimed towards the sun there was a most dramatic increase in receiver noise.

Good luck with your project.
John

The sun can be very helpful. At a Dew Line location where we had just
completed the Radar installations, two complete Radar equipments with

back-to-back antennas, the echo returns didn't look as we had expected, but it was late in the day, so we gave up for the night. The next morning it was observed that the sun was showing on the scopes, 180 degrees off.

If you don't get an answer--the FT-243 rocks are fundamental cuts. It would be easy to build an untuned Colpitts oscillator, and use a counter to determine the crystal frequency. A simple c-mos IC oscillator would probably also work.

ANOTHER WAY IS TO USE AN MFJ ANTENNA ANALYZER - JUST USE ALLIGATOR CLIPS TO HOOK THE XTALS PINS TO THE SO-239 ON THE ANALYZER -

TUNE ACCROSS - THE RESONANT FREQ WILL SHOW AS A 1:1 ON THE ANALYZER METER - JUST READ THE FREQ OFF THE LCD.

- or -

USE ANY XTAL TRANSMITTER BY PULLING OUT THE BUFFER/DRIVER TUBE AND TAKING A FREQ COUNTER OR SW RECEIVER NEAR THE OSCILLATOR TUBE AND KEY THE TRANSMITTER.

OK I NEED HELP - REALLY I DO ...

I AM PLAYING WITH A MICROWAVE OVEN -

WOULD LIKE TO REDUCE THE POWER OUTPUT OF THE MAGENTRON -

AS IT IS - IT IS SETUP FOR 600 WATTS PULSED ERP - THAT IS SHE PEAKS AT 600 WATTS 60 TIMES A SECOND -

ANODE VOLTAGE IS 4500 VAC THROUGH A 125 VAC STEP UP TRANSFORMER.

I WANT TO KEEP THIS VOLTAGE BUT WANT TO REDUCE THE CURRENT TO REDUCE POWER.

BEST WAY I THINK IS TO REDUCE CURRENT ON THE PRIMARY 120 VAC SIDE OF THE TRANSFORMER.

CAN'T REDUCE VOLTAGE OF 4500 VAC BECAUSE MAGNETRON FAILS TO OSCILLATE AND DRAWS A LARGE PLATE CURRENT.

ANY IDEAS ? ALREADY TRIED A VARIAC ON THE PRIMARY - IT REDUCED VOLTAGE BUT DID NOT REDUCE POWER UNTIL THE MAGNETRON STOP OSCILLATING COMPLETELY.

ANY HELP WOULD BE APPRECIATED

- BIZ WDï¿½HCO

Hi,

I wouldn't trust the crystal holder channel number to determine the
operating frequency.
It was very common after the war to reuse holders with different
crystal blanks. I've got a few here with paper labels giving
the actual crystal frequency, which has nothing to do with
the channel number embossed on the crystal holder.

Many surplus crystals were reground and mounted in the old holders,
here is a web site showing the technique used:
http://www.subdevo.com:82/n4jvp/crystal%20grinding/CrystalGrinding.htm

Lionel,

Why don't we create an SCR 522 fan club? I eventually replaced the
832 PA with an 829B and ran about 70 watts, modulated with a pair of
1625's on two metres AM. Golly, those were my "wonder years". I was
still a kid in high school. I still have some 522 stuff about, but no
complete units. I do recall that all the equipment tags have the RAF
insignia.

John

Hello every one ,thanks for your precious help, thanks Thierry for the
schematics well arrived at home and well printed ,time will be long now
the bc624 come from Honolulu....yesterday I went to my garage and
got the bc 625 (transmitter) I already have ,it is in nice condition.The
reason I plan to use the bc624 in radio-astronomy is simple :it is a
radio-set I found on ebay at a reasonable price (shipping included)
(before ,I had looked at hamfests in France ,and did not find receivers
in vhf old enought-1960 was the oldest),I am a long time om ,and doing
radio-astronomy on the sun since 20 years with 'good' receivers,this
project is to test with the receivers of the time of the discovery of
radio-astronomy,nostalgia ...
For those interested there is a book 'The early years of
radio-astronomy' at Cambride university press ,that describes the
material used at that time it is very interesting . In fact Reber
at the beginning around 1939 used a 31 feet parabola and a trf amplifier
with 4* 955 acorn tubes amplifier,and a 953 acorn diode ....the bc624
is of the nearly same time but as a superhet will be more sensitive ,the
9003 input tube is the successor of the 955 acorn in an another 'box'.
This is for some explanations of all the questions.

Of course if a scr522 fan club is done ,count on me with the bc625 and
bc 624.
Thanks again all of you 73 alain f1gqb

932. FS: Johnson Ranger Part and Manuals

I have an Ohmite 20K tapped PS screen resistor (R35) for the Johnson Ranger. It came out of mine a few years ago when I used another system for the screen. It is in good condition and not burnt. If anybody wants a spare, let me know and make an offer for it.

I also have a copy of the Ranger manual and circuit plus an original Catalogue (No. 959) of the complete Johnson line of gear with all prices etc. It illustrates every product from the Adventurer to the Desk Kilowatt. In Excellent condition.I also have Catalogue No. 724 which is the original Ranger two page brochure. The postage from New Zealand to the USA will run about $10.00 USD and I am open to offers on it rather than put it on eBay. Can't be bothered. :)

One offer for the lot please!

G'Day John
I am sure that many of those who used the SCR522 in the past have passed
on. When I used my SCR522 on 2 metres there was no TV and consequently

no TVI. I think that TV changed all that. Even had one that was converted to 6 metres (the TX not RX).

There was a rather large mains power supply, the RA62 produced in the USA for the military.

The RAAF (Royal Australian Air Force) also had mains power supply made under contract and they are heeeavy.

The RAF and RAAF designations was the TR5043.

I believe it was descended from the RAF TR1143 VHF set which was used very successfully in the early days of WW2 for fighter control. When the Americans saw the successful use of VHF they took a TR1143 back to the USA and "Copied" it and produced it as the SCR522.

Only ever saw one TR1143 in a surplus shop. I think that the TR1143 would be very rare nowadays.

Someone will correct me if I am wrong about this.

First, you are missing an important electronic's fundamental: You cannot reduce the anode current into a magnetron without also reducing the anode voltage.

The reason your magnetron is quitting oscillation, is you don't have enough power going into the filament. You need a separate filament transformer. Be sure that the filament transformer has adequate insulation to handle the anode voltage of the magnetron. The filament is running full anode voltage below ground on most ovens.

If you reduce anode voltage, using a variac, the power output will reduce quite nicely, but will be very nonlinear.

Depending on what it is you are trying to do, a possibly better way is to build a cycle stealing power controller for the primary of the transformer.

What you do is this, build a triac controller that basically works as a relay on the main power, and using a zero crossing detector, and a counter,

turn off one cycle of the AC (at the zero crossing), for every 10 cycles, and you will be at 90% power, 2 cycles, out of 10, and you have 80%, 3 cycles out of 10, and you have 70%, ...9 cycles out of 10, and you have 10%. Because the transformer, and power supply filter capacitor cannot respond this quickly to the cycle loss, you will have a smooth reduction in your power, unlike the conventional oven's full power/no power duty cycle modulation.

For best results, the removed cycles should be evenly distributed throughout the 10 cycles. If you need finer control, you can use more cycles... for 1% control, 100 cycles... This is a great place for a PIC microprocessor.

Hi Irv....

I looked high and low and couldn't find a direct replacement. I
did find a relay that was close but would require a slight bit
of rewiring. I don't have the info right at my fingertips but
will dig around for it if you're interested.

Might I suggest that instead of trying to vary power supply conditions,
you change (lower) the PRF (pulse repetition frequency). That will
reduce the average power out to whatever level you wish.

I don't know offhand, BUT I know one of the Hints and Kinks books has
a Pierce crystal oscillator circuit intended as a crystal tester. One
FET, a couple resistors, and you take the output to a counter. Now you
know what any crystal is, even one that some ham has polished down to a higher
frequency. I have seen quite a few hamfest crystals that have been
modified since they were surplussed.

You can't do that. From the supply side, the magnetron is basically a big
diode. There is no grid. All you can do is adjust the voltage across it,
and the current will follow.

>ANY IDEAS ? ALREADY TRIED A VARIAC ON THE PRIMARY - IT REDUCED VOLTAGE BUT
>DID NOT REDUCE POWER UNTIL THE MAGNETRON STOP OSCILLATING COMPLETELY.

Right. It's not really intended to operate over a very wide range.

There _is_ an article from Radio-Electronics in the mid-nineties on
those things... they give some methods to modify them and to get them
operating well out of their normal regime. Detuning it may be the
easiest way to reduce the output level.

Hi All,
I have a Panasonic RF2200 for sale. It is in VERY good shape, with no problems EXCEPT for one. The telescoping FM/SW antenna does not collapse all the way. Other than that problem, the set is a good performer. If you know your vintage solid-state sets, you know what these radios are capable of and this one is no exception. It comes with its original power cord, shoulder strap and (if I can find them,) copies of the service manuals. I am asking $150.00 plus shipping from the 07860 zip code. Photos are available to interested buyers. Please email me directly for details.

REDUCE THE POWER BY REDUCING THE DUTY CYCLE BY VARYING THE ON-OFF TIMES.
YOU SHOULD NOT BE PLAYING WITH MICROWAVE OVENS IF YOU DONT UNDERSTAND PULSE
OPERATION. WHEN YOU DROPPED THE VOLTAGE, YOU ACTUALLY HURT EFFICIENCY. IF
YOU HAVE LIMITATIONS ON THE MAINS SUPPLY, GO WITH A SMALLER MAGNETRON. I.E.
CHECK THE LABELS BEFORE YOU BUY. MOST CONSUMER MODELS PULL BETWEEN 8-15
AMPS DURING THE ON CYCLE. i SAW A CLAMP ON AC AMMETER FOR 20 BUCKS
RECENTLY. TRY BEFORE YOU BUY.

And since the filament winding is on the same transformer, it will
also lower the filament power proportionally, just like with the variac.
You still need a separate filament transformer.

Chuck,
I think it might have been more a case of "immitation is the best form of flattery". I wasn't old enough to remember, but us Yanks were probably using all HF radio in our fighters and bombers. But once we got involved in the war effort, the success of the RAF and others with VHF radio must have told us that we needed similiar equipment. We could have certainly started from ground zero with our own designs, but reliable aircraft communications was a vital factor at the time, and VHF, being still a new form of transmission in those days, would have taken months and months on the drawing boards and lab and field testing to come up with a viable, operational unit.

I can see where it could have been quite desireable to take a known working design, put our Yankee spin on it and get it into production. We and the Allies had a big job ahead of us over there and time was of essence. And yes,we were lending and loaning supplies, equipment, manufacturing, (and fighting men as well), as a part of a team effort to resolve a terrific world threat.

John

Hi John,

Everything I read says the SCR-522 was a redesign of the British TR-1123,
that was done to make it possible to mass produce it with US tooling.

Certainly the US used the TR-1123 design as a quick way of getting a working
VHF design into the war as quickly as possible. It was several years before
the much more capable ARC-1 came out.

My only objection was the way the OP stated that it was copy. It had the
familiar taste of US bashing. If I read the OP's intentions incorrectly,
and it sounds like I probably did, I am sorry.

For more details, check out www.aafradio.org - the Americans could not communicate with t-he British who were using VHF in their aircraft, so the SCR522 was a "copy" of the British design until the Americans could do the necessary R & D. No slight on our American friends intended - stop being so paranoid! - when we do want to insult you, you will be left in no doubt hi hi

Well,
Chuck, Andrew, and Lionel,
I'm glad we got this topic resolved. And further discussion of the BC 624 and 625 can now begin.

My first two meter rig was a home brewed transceiver using a design from the old 112mc. WERS (war emergency radio service) band. I used a 6C4 triode as a super-regen detector which reverted to an ultra audion oscillator on transmit using a multi-section rotary switch. 6AT6 1st audio/mic amplifier and 6V6 audio output/modulator. I had a buddy across town that shared interest in two meters and he had a similiar rig, but with a single 3A5 dual triode tube and it used batteries.

My rig ran on a 150 volt supply and would just light a #47 pilot lamp as a dummy load. My friends rig on "B" batteries showed no output with a lamp load. But it worked! We were about 3 or 4 miles apart and made a solid QSO.

My first real two meter rig was a T23/ARC-5 transmitter that I bought at a surplus dealer for $12. That prompted me to build a crystal controlled converter using two 6AK5's and two 6J6's and used that ahead of a Hammarlund HQ-129X receiver. Built a home made 5 element Yagi made from old TV antenna hardware. I was on the air on two meter AM in fine style.

The 522 came along a bit later when someone gave me a bunch old stuff. I spent many hours replacing all those Micamold paper condensers in the receiver. I had a lot of fun with the 522 and the T23 and learned a whole lot about VHF. My present day knowledge has not advanced anything beyond those days prior to 1960. Ha!

For you chaps down under, talking about old times motivated me to pull an early log book. My first QSO with VK land was VK2EG on 14.065 mc. in 1957. I was running 100 watts input to a pair of push-pull 807's and a ground plane antenna. And the HQ-129X receiver, of course.

Been a long day, I'm gonna grab a cold 807. Hi!

73, John

All,
In the late 50's, all of us who wanted to get on 2-meters used the '522 transmitter. I also seem to recall that we could, and did, trade the finals either the 832A for an 829B, or vice versa, to get a bit more power. I think there was a mechanical consideration, too.. but that was a long time ago! That transmitter, plus a Tapetone or Tecraft receiver converter, and you were on your way. de K3HVG

Hi Lionel, Andrew, etal,

I am sorry for over reacting.

My first 2M rig was a decidedly breadboard contraption that used a
6J6 as a push-pull oscillator, and had a modified phonograph audio
output stage as the modulator. It had no xtal, and drifted so badly
that I could never be sure where I would end up. I ditched that
mess, and used a borrowed ARC-1 in its original 28V dynamotor condition.
The ARC-1 was pure pleasure to operate. It sounded nice (inspite of
its carbon microphone), and could change channels at a whim.

A lot of folks swapped 829's in for 832's in some of the vhf rigs, but
the ARC-1 was too compact for that treatment. The 829 was a fair bit
taller, and would run into the top of the bakelite socket assembly
the ARC-1 used.

-Chuck

New Program - OP_ANGLE.exe

This program assists with understanding, choosing and setting the
operating angles of Class-B and Class-C RF power amplifiers.

The operating angle underlies all performance characteristics.

Although RF operating conditions for tubes can be set up using
manufacturers' data sheets, the program refers to use of a tube's
Operating Characteristic Curves.

Download program OP_ANGLE in a few seconds from website below. Not
zipped up. Run immediately. File size = 39 kilobytes.

Thanks, Pete, and I had looked at that. The manual only shows it being connected to the companion transmitter (HX-20) for power, but does not show what voltages will be comming out of the transmitter power socket.

I'll hope there is someone with this on the operating table that can supply (hoho) with the voltage requirements.

They work in a manner that is very similar to the way the old
60Hz transformer style ovens operate.

They convert the mains AC to DC using a voltage doubler (US),
and convert the DC into a 100KHz square wave that feeds a small
ferrite cored transformer that contains a HV winding, and a
filament winding.

"Power" is controlled by cycling the oven on and off over a
10 second cycle: 10% = 1 second on, 9 seconds off, 20% = 2 seconds
on, 8 seconds off, ...

Dropped by UPS......can be repaired, I have no further interest old rcvr's or older much of anything.
I sold & and shipped it... they dropped and unit was returned to me. I have pix.
Cabinet warp about 1/4" needs warp straightening. Front panel paint & else-where pretty dang good for age.
Might trade for older CW-AM tx 50-75w or prefer $90. shipped. Will easily cost 15-20 to ship. Poor health dictates no further interest old stuff. AL k2erg@arrl.net

>the 9003 input tube is the successor of the 955 acorn in an another 'box'.

Alain,
I was pleased that you mentioned the 9003 being the successor of an acorn tube. I started to mention that when I said I replaced the 9003's with 6AK5's. There was a series of 7 pin minatures that replicated some of the acorns.

I think the 9003 was actually the replacement for a 954 pentode acorn and the 9002 (also used in the BC 624) replaced a 955 triode.

My B&W grid dip meter that I've had for a hundred years uses a 955 oscillator. And I did some tinkering in those early days with portable 2 metre equipment with 957 battery triodes. One small transmitter I built used a single 957 ultra-audion oscillator and I modulated it with a Shure magnetic microphone in series with the grid resistor ground return. Pretty simple circuit. It sounded great on the BC 624!

What type of antenna array do you plan to use? Do you know the frequency range that was used in the early experiments that you mentioned?

John

The S-38B has a cardboard back and bottom. Only the early runs of the original S-38 had a metal bottom with a cardboard back. All the later versions the S-38A, S-38B, etc. had cardboard bottoms and backs.

Best Regards,

Ed

Ed,
Thanks for the quick reply. I saw a place on the net that had the
backs for the S-38 and the A model but a little trimming would do the
trick. Another site had the template for the bottom also. Would you
happen to know what size the rubber grommet/feet were on the bottom?
Thanks,
Bob Grimes

Well looking at the HR-20 Manual on bama, page seven shows the supply
volyages as either 6 or 12 volts for
the filiments and 275 to 350 vdc for the plate supply. The schematic
on page 15 shows the interconnect.
And who ever supplied the manual even has the jumpers marked for
operation.

Bob Piekarz, Bob's Antique Radios in LaGrange Park, IL
http://www.radioantiques.com/

has the backs and bottoms for the Hallicrafters S-38 and S-38A
http://www.radioantiques.com/mall.html

Since these radios were manufactured in the Chicago area,
Bob was able to find the original firm that made these fiber board backs and
bottoms for Hallicrafters.
SO, you get the real McCoy (same material, same mfg.) .. abit 50 years
later.

Hello John
first of all to share my happiness ,my bc624 is at home ,it took just a
week to come from Honolulu to France .This fact itself is
marvelous!!!It is in perfect good condition.It is marvelous to see 60
years old radio-set in such a nice condition ,it is nearly complete
,only the front panel mechanic to select channels ,has been removed .As
a begining I plan to use simple 2m yagi ,I have three of then 'tailored'
on 150 mhz that is an official band of radio-astronomy (shared with
other services).In the beginning of radio-astronomy after several test
on microwave (around 3ghz) ,G.Reber finally used 169mhz ,a frequency
that is still in use in radio-astronomy
in several observatories .Here I have been using that frequency with
modified vhf radio-reciver (just cut one turn out of the input coils
,and tune again ,and tv antennas are ok)alas now there is lot of qrm by
vhf relais ,it is a local problem .I'll keep you informed .

You are right about the tubes ,I also have a gdo of that kind ,and several acorn tubes .Thanks ,good bye 73 alain f1gqb

Hello all !

The Drake Forum will be one of the Forums at The Dayton Hamvention 2006.

I'm going be one of the speakers with a new picture-presentation of Drake stuff.

And a lucky person will be the winner of a DRAKE TR5 transceiver in excellent
mint condition!

Take a look at http://home.online.no/~sindtorp/tr5raffle.htm for more details about the raffle and the program for the forum.

See you at The Dayton Hamvention 2006.

Not much luck on abpr, so I'll try it here. Got this on ebay just for the fun of it, pics on binary under whatzitfor. It's a Signal Corps Frequency Meter type BC-153, 75 to 1500kc. It consists of a large tuning cap and three coils that are switched in series to get three different bands, 75-225kc, 200-700kc and 600-1600kc. These form a tank circuit with a meter in series with the tuning cap and coil. It also has an adjustable buzzer feeding the top of the tank, and a battery for the buzzer. I figure you set the buzzer going and pick up the freq you want with the tuning. Someone has put a dc voltmeter in place of the original one, probably was an ac ammeter, which shows the internal tank current, a power indicator probably? There are no external connections except to add more inductance for a lower resonance. My guess is, this tank circuit radiated the resonant frequency to be picked up by a receiver, like a sig gen. Any guesses out there, and what type meter might have been used? I think this might be early 30's. Any info available? Ken

It sure came in handy the last couple years right after the
hurricanes ripped down power poles and electric lines here in Marion
County, Florida. No electricity, roads closed and no stores open so you
ate cold canned goods. i have a dozen cans already for this year's
hurricane season, along with a couple large jars of peanut butter and
several boxes of crackers. It was weeks before the stores had fresh
fruit and vegetables, or much of anything else. :(

From: Edward Greeley <etgreeley@earthlink.net>
Message-ID: <A4sJf.337$5M6.246@newsread2.news.atl.earthlink.net>
Source record: 13446

Looking for the following tranny at less than the "E-Place" price:
Primary 110-120 VAC; HV Secondary 480 to 600 VCT @ 65 ma minimum;
Filament Secondary 6.3 V @ 2.5 A minimum. Don't need a 5 V Secondary but
can use a transformer that has one of course. Prefer open or enclosed
upright mount but can use half-shell horizontal mount type if necessary.
This would be for an elderly, 5 tube Kï¿½rting (German) radio.

What'cha got?

Thanks,
Ed Greeley
Mobile, AL

Chuck,

I feel your pain. My first attempt on 220 mc. was about 1965 and I used a breadboard contraption with a push-pull 12AT7 and I used the output section of an Olson reel to reel tape recorder as a modulator and B+ supply. It worked OK. Maybe a watt if I was lucky.

I remember the ARC 1's and was there an ARC 3 or 4?, but the 522's were very common. One of my high school buddies had a 522 in the original equipment case with the contol box. When he changed frequencies, what a sound! Kind of a clacking, ripping noise as those shifter slides did there thing. But it worked and sounded good. And my "S" meter kicked up when he talked. If you recall, the driver was modulated along with the PA.

I used 829's (or 3E29's) in both my 522 and T23/ARC 5 rigs. In the T23, I got rid of the PA turret assy and replaced it with a nice 4 turn center tapped coil and butterfly tuning condenser (from a 522 with a couple of plates removed).

Those were the days! They'll never return, but I'm glad I was there and had the experience. Sorta like steam trains and "hot boxes". How many people today have ever seen a hot box? I'm glad I have the memories, and no one can take them away.

It's not quite like that.

But they do have moving parts, though not quite as you imagine them.

Put a transducer on one end of a can to convert signal into mechanical
motion. Have it drive a thin, stiff rod along the axis of the rod.
Along the rod, at regular intervals, solder or weld the edges of a few
(maybe as many as 5 or 6) discs of metal, so that the discs are all
concentric. Now solder or weld another thin, stiff rod to all the
discs, 180 degrees away from the first, and put its free end into
another transducer at the other end of the can; the second transducer
converts mechanical motion back into signal. The center frequency and
bandwidth are determined by mechanical properties of the discs.

Collins developed these as small, sharp filters with steep skirts,
relatively-good passband ripple, and tolerable loss.

See
<http://www.rockwellcollins.com/about/additionalproducts/collinsfilters/page4667.html>
for information on more modern mechanical filters as well as the old
"drumhead" filters I describe above.

A Google search on "collins mechanical filter" will produce a plethora
of useful hits, too.

1015. Re: I-177 tube tester reads 2-3x to high on gm.

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-02-19 14:18:17 UTC
From: piero soldi <piero.soldi@libero.it>
Message-ID: <J6%Jf.2934$H6.40244@twister2.libero.it>
Source record: 13465

Randall, the I-177 tube tester uses 3 shunts for 3 ranges of gm measure.
My I-177 was defective, the shunts were broken, so the measure was not ok.
These shunts are near a switch, as I can remember.
The repair was done a lot of years ago, so control by yourself !
bye from Piero (ex I1SPO, ex I5SPO).

1016. Re: May be OT - Mechanical Collins filters

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-02-19 18:19:25 UTC
From: COLIN LAMB <k7fm@teleport.com>
Message-ID: <NE2Kf.3058$UN.1376@newsread2.news.pas.earthlink.net>
Source record: 13466

Crystal and ceramic filters are also mechinical filters, since they depend upon the mechanical resonance of the quartz or ceramic.

I recall that some of the radio companies have advertised that their radios had mechanical filters, when in fact they had ceramic filters.

As mentioned in the latest Electric Radio, Zenith apparently developed the mechanical filter but decided it was not that useful and abandoned the idea a number of years before Collins revisited it.

From: Reg Edwards <g4fgq.regp@ZZZbtinternet.com>
Message-ID: <dtapd2aar1@nwrdmz01.dmz.ncs.ea.ibs-infra.bt.com>
Source record: 13468

NOW AVAILABLE ** New Program "OPANGLE3.exe"

Choose and set plate current operating angle for Class-B and Class-C
RF power amplifiers.

Input data includes control-grid plate-current cut-off volts, DC
negative grid bias, and peak grid drive volts.

Advice on how to use Tube Operating Characteristic Curves is included.
For interest the plate current harmonic content is computed up to the
21st harmonic.

For given DC plate supply volts and peak plate signal volts, the DC
power input, tuned load resistance, RF power output, plate dissipation
and efficiency are computed.

This is a repeat of program Op_Angle (now withdrawn) with the addition
of an analysis of conditions in the plate circuit.

Program size = 50 kilo-bytes.
Download OPANGLE3 from website below.

Well, it is a mechanical filter, just not the one you're thinking
about. A crystal filter is mechanical, as well, but its dishonest to
try to make people think they are getting a machined metal mechanical
filter.

I can't be the only one this idea has occurred to. When rebuilding automobile engine blocks, there is a stand that bolts to the back of the engine block, you can turn and lock the block in any position, to make the installation of parts much easier. Has anyone come up with such a device to bolt to boatanchor chassis' that would make repair or restoration easier?

There's a guy in Oklahoma City, a retired wood shop instructor, who has designed a chassis stand just like that. There's a large and a small version. They work like champs, and he does beautiful work, as you might expect from his previous life.

I have his contact info around somewhere if you're interested. I can also send a drawing of the large stand as a .pdf file.

> > Don
> >

Wohoooo here, maybe, since I caught this thread in mid stream, I am out of place, but Don, your last sentence, "Do remember that the carrier amplitude does NOT vary with modulation." doesn't sound like high level amplitude modulation.

When I was young(er), amplitude modulation meant exactly that: carrier amplitude varying with modulation. In fact, when working out the bugs of home designed and built AM transmitters, one favorite test was with an oscilloscope, measuring the amplitude of the carrier, making sure that the carrier amplitude did actually approach zero and rise to twice the unmodulated carrier level. (voltage, not power, of course)

Now, for sure, the carrier average POWER didn't vary (much), but the audio power was added. Now, PEP, peak envelope power, is a whole different thing for us old timers, and maybe that's what is being discussed here. In that case, please excuse Mr. Buttinski!

Hi, Lynn

The oscilloscope monitor on an A.M. transmitter output
doesn't show the carrier (except during periods
of no modulation). The scope shows the resultant
of the carrier and both sidebands added together vectorially.
A spectrum analyzer would show a constant amplitude carrier
in the center of the A.M. spectrum.

There is a good description of the process at the Agilent site.
Google a.m. phasor diagram
Click on "Spectrum analysis AM and FM HP T&M Application Note 150-1"
Beginning on page 48 of the pdf file is a description of the a.m.
spectrum, based on phasor diagrams.

Source record: 13481

Once again I'm looking for the schematic/manual for a lessor know pice
of ham equipment.

I have a GLB-400 Channelizer. This was used to add more "chanels" to
rigs like the IC-22A
I'd like yo at least power it up and see if it works. Unfortunately it
is too new for bama.

Thanks to this group I did find a manual on the Crosby 166 SSB receiver
I needed and now that's available for download from bama. This unit is
just a shot in the dark.

Thanks

Jim

An old TV shop might still have one of the stands they used for the
old tube type color TV's. They had a very heavy chassis and needed to
flip it around too. They were adjustable for width and clamped onto
the chassis on the sides.
Check out an old Allied Radio catalog to see what they looked like.

FS A nice Kenwood TS-820S. This is the one with digital readout. The transceiver has been stored for
around 10 years and not been used a lot. It is from an estate. It looks and works great. It has full output from the original tubes. It would be near perfect except that the plastic extension for the Noise Blanker toggle switch has come off. This is a push on type extension and can be easily replaced. The NB switch can be operated like it is. The original manual is included along with the AC Power Plug. Price is $345. Thanks, Charlie Hugg, K5MBX

If you will be so kind as to check eBay item #5869648625, a Hallicrafters Super Skyrider, (not mine, I have no connection whatsoever) I am wondering how the cabinet can be in such horrible shape and the faceplate be so ..... minty. Has the faceplate been restored?

From: Uncle Peter <radioconnectionNO@cox.netSPAM>
Message-ID: <oauKf.14506$2c4.2055@dukeread11>
Source record: 13394

Guys

I'm looking for a formula, or preferably a program, that will let me design a matching pad that will let me set Z1, z2, and the dB loss. I have the formulas for the minimum loss pads, but they would require a second fixed attenuator to set the dB loss to the -20dB I desire. I'm looking to build some 50 ohm to various higher impedances for use on my signal generators to match the higher impedances found on boatanchors, etc.

Or, would it just be easier to use a minimum loss pad with a second symetrical pad to get the desired loss?

Pete

What frequencies and impedance ratios? I like to use RF transformers
with half the attenuation on each side to insure the proper levels and
isolation.

The first ones I wound were on the six hole ferrites for 50 Ohms one
on side, and 75 Ohms on the other. By tapping it at five turns you get a
1.2 -1.0 turn ratio, or, 1.2 * 1.2 * 50 = 70 ohms. Toroids are better
for some ratios and frequencies.

RF transformers would be okay if using the dBm scale, since power is
a constant. For uV measurements they won't work, since the voltage
will be stepped up in the matching. i.e. the uV reading on the
generator will not be the same as the reading on the antenna terminals.
A 20 dB pad gives the same voltage reading (by a factor of ten) permitting
the attenuator scale to be reading without involving winding ratios, etc.

Also,
a 20 dB attenuator virtually assures both devices will be looking into a close match.

Pete

The poor man's solution is heavy metal "L" braces screwed into the radio's own chassis mounting holes. Go to this page and scroll down to "A Cheap and Simple Chassis Holder" for a photo and description.

http://antiqueradio.org/MidwestDD-18.htm

Haven't tried it on a boatanchor yet, but it worked great on this heavy 18-tube chassis. Costs only a few bucks. No woodworking (or metalworking) required. And the braces take up virtually no room when not in use.

1052. NC-300 Crystal Filter

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-02-22 19:38:49 UTC
From: Al <aschichler@microwavedata.com>
Message-ID: <1140637129.117500.193100@g43g2000cwa.googlegroups.com>
Source record: 13402

I was wondering if anyone out there is familiar with the normal
operation of the NC-300.
I recently bought an NC-300, and have restored it so it is working
pretty well and calibrated, but I'm not sure if the crystal filter is
aligned correctly or working exactly the way it is supposed to. The
phasing control variable cap was cracked when I obtained it, so I had
to glue it back together and align the plates so they don't ever
touch each other. Now I'm not sure exactly where the capacitor is
supposed to be positioned when the phasing control is in the middle
position, since I had to take it all apart and put it back together
again. I think I have it adjusted pretty close, but the resonant
frequency seems to be slightly different in each of the different
selectivity positions. Also, the signal strength seems to be quite a
bit higher with the crystal filter switched in the circuit compared to
being in the "off" position where it is switched out. Is this
normal, or is there maybe a cap that has changed value or something
like that?
Thanks for any help,
73,
Al, WA2AS

Alignment is cirtical in the IF filter. You need a really good generator
(preferablly with a digital display) to properly do the alignment.
It could be that the crystal has changed thus causing the discrepencies on
the various switch settings.
I am betting that a critical alignment will make things clear.

> position,

To quote Collins, who used a similar scheme in the 51J4:

"The Primary purpose of Phasing capacitor C188 is to produce a
controllable rejection notch in the i-f response curve so that
unwanted hetrodynes may be tuned out. The section of C188
connected to the bottom end of T101 secondary provides a
capacitive path around the crystal that balances out the
shunt capacitance of the crystal in its holder and external capacitor
C187. Varying C188 ether side of the balance point varies the
antiresonant frequency. Thus at antiresonant frequency points
the phasing action gives a sharp dip in response and the selectivity
curve takes on a notch as illustrated in figure 4-6."

C188 is the main phasing control, and it has a funny butterfly
moving plate, and two isolated stationary plate sections. Think
of it as a "push-pull" capacitor.

On the proper position of the knob, they say:

"line up the crystal filter PHASING control knob with the panel
mark and with the mid-range position of the phasing capacitor.
To accomplish this, with the aid of a flashlight, look into the
right hand hole in the top of the crystal filter cover in order
to see the plates of the phasing capacitor. Turn the PHASING
control until the rotor plates are straight down toward the
bottom of the receiver, ie., until the rotor plates completely
engage the bottom set of stator plates. Loosen set screws in
PHASING control knob. Set knob line 90 degrees to the left of the
panel mark. Tighten set screws. Turn knob to panel mark. Phasing
capacitor is now at midrange."

Not quite what you asked for, but I think it might help.

-Chuck

It's an audio DSP noise filter. For instance, it provides random noise reduction and auto-notch filters. These help get rid of backgound noise and heterodynes (squeals). You place the fletr between you receiver and an outboard speaker or computer sound system.

Thanks for the information. That's the closest to what I was looking
for than anything else I have seen.
That phasing cap sounds like the same type used in the NC-300.
So, if I have it right, it sounds like midrange on the phasing control
is 90 degrees clockwise from the point where the rotor plates are fully
meshed with the bottom set of stator plates. Hopefully I can apply this
to the NC-300 and get it aligned correctly.

From www.timewave.com web page:

DSP-9+

The DSP-9+ uses digital signal processing technology to provide optimum filters for random noise reduction, heterodyne elimination and bandpass filtering. Digital Signal Processing (DSP) technology provides superior performance in reducing QRM and QRN.

It works on the audio signal before it gets to your speaker and does a fair job.

I have an MFJ (Analog Devices engine, AFAIK) DSP. While it does
reduce noise it doesn't enhance the ability to ID a station. It is
kind of cool for taking the tones off WWV.

These things really shine when using the digital modes, so I'm told.

Just purchased a Hallicrafters S-38 and the restoration is going well. However, the rubber insulators that separate the cabinet from the chassis are bad. Does anyone have a source for these, or perhaps know a good way to homebrew these little but quite necessary items. Your help would be appreciated. Thanks

1075. SWAN-500C Improvments

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-02-23 19:34:34 UTC
From: gene@csl.uiuc.edu
Message-ID: <dtl2oa$op6$1@news.ks.uiuc.edu>
Source record: 13425

Although I have a later digital transceiver (Icom-751), I recently acquired a Swan-500-C from an estate. It had been in storage for 25 years. I have had fun working on it's quirks and returning it to very good performance, even by today's standards:

The first quirk was not staying on frequency (not related to time/heat drift). Slightly wiggling the bandswith knob caused slight changes in voice pitch. And what was worse (and intolerable in a group discussion) was that often Transmit on a slightly different frequency than it received on. A change of more than 100 Hz or so is usually intolerable.

My initial thought was oxidized bandswith contacts. I bought some "Deoxit" at Radio Shack dowsed all the contacts except the ones in the VFO compartment. This may have helped slightly but problem was essentially the same. Then I "Deoxed" the bandswitch contacts in the VFO compartment which I SHOULD NOT HAVE DONE, because the material is a different plastic and was severely affected. It changed the frequencies by more than 30 KHz...probably by changing the dielectric constant of the plastic material. I quickly rinsed this off with FREON-TF and frequencies returned almost to where they were before.

The original problem still mostly existed after all the contact cleaning. I had even used "PB-Blaster" rust solvent from Auto-Zone on the main bandswitch (not the VFO) which made no noticeable difference. I finally flushed all the contact cleaners back off with FREON-TF which pretty pretty much leaves them clean and dry.

HERE'S WHAT SEEMS TO HAVE BEEN THE MOST SIGNIFICANT "REAL" PROBLEM:

While trouble-shooting the problem, I monitored the actual VFO frequency (which is always the operating frequency plus or minus 5500 KHz in "Normal" sideband), with my Icom-751 listening as a frequency-meter:

I found that tightening, or loosening the mechanical linkage between the two band-switches (VFO and lower gang), the "pitch" of tone I was listening to on the Icom changed by about the same 100 or 200 Hz as exhibited in the origanal problem. The long band-switch shaft passes through several wafer sections and is only grounded near the knob and de-tent assembly which provides a poor and un-reliable ground. (Slightly wiggling the band-switch knob always caused a significant change in the tone pitch I was monitoring).

Apparently, when the shaft was not firmly grounded, it provided a capacitive-coupling path between certain wafers that caused the problem.

AS A CURE, I soldered a flexible jumper (Pig-tail) between the lower shaft and chassis ground, and also a jumper on the larger section of the mechanical linkage above the chassis to ground.

On a different aspect of improving the SWAN-500 performance, I used and external wall-receptacle-mounted transformer to light a 12 volt auto tail/stop light and placed it against the VFO compartment to simulate heat when the transceiver has been on for awhile. Although probably not necessary, I took the opportunity to negative-rectify this 12 volts and send it in one of the accessory socket pins (I don't have the pin# handy, but it goes the 25W 10-volt zener(-10v) mounted under the chassis. You may have to limit the current to the zener with a resistor if your

voltage is excessive. This keeps the transistorized VFO section running at all times.
I have found that remarkably, there is virtually no warm-up time required for
SSB standards operation...comparable to the digital frequency-synthesized more
modern transceivers. Of course you disconnect the external heat while operating
the transceiver.
If better voice quality is your preference, the SWAN provides this by using a
wider crystal-filter band-pass of 2.7 KHz which is noticeably better than the
Icom-751 which is 2.3 KHz bandwidth, and some transceivers even use 2.1 KHz.

Perhaps I should add a cautionary risk-warning for the less experienced
who choose to energize the VFO during off-hours as described above:
During normal operation on mine, the current to the -10v zener set the
voltage at -10.1 volts. When I substituted an external source when the
transceiver was turned off, I selected a resistor to supply enough
current to read -9.9 volts at the zener....thus ensuring that the current
is not excessive. Accordingly, you should be sure to disable the external
current supply (and heater light) before you turn on the transceiver to
prevent BOTH currents energizing the zener. It would probably tolerate it
temporarily but if it were destroyed so as to "open up", the soaring
negative voltage might destroy the VFO transistors.
A wide variety of external power sources could be accommodated...AC or
DC, but if AC is used, it will require an external rectifier with the
Cathode toward the transformer, and Anode toward the internal zener. No
filtering required.
In my particular case, I had a unit labeled 13.5 vdc @ 1A.
On the auto brake/park bulb, I chose to solder to the two lead contacts
(ignoring the shell). This runs the Brake and Park filaments in series
and of course most of the illumination is the Park filament only. My
voltage across these measured 11.25 volts dc but of course it could
also be 11.25 ac. Although with my negative dc supply, I didn't need
the rectifier diode, but I used one anyway as a precaution against
accidentally reversing the dc supply. As noted above, this amount of
heat seems to simulate the normal operating heat quite well since I
experience virtually no warm-up time required for freqeuncy stability.
On accessory socket J6 on the Swan 500-C, chassis ground is pin #9
and the external zener current goes to pin #3 or #4 (They are jumpered
together in the octal plug) and of course you leave the plug inserted.
For other Swans that might have different wiring, the zener is a
25 watt, insulated, stud-mounted 1N2974-A.

A couple of other tips that might be useful to some:
Although my receiver was functioning satisfactoriy, the S-meter
readings seemed stingy compared to my Icom. Removing a capacitor
is an easy fix for this:
The high-end of the Audio Gain pot (R-1201) has a capacitive-divider
of two .001uf's in series which divide down the audio voltage derived
in the Product Detector. This midpoint goes to AGC amplifier/detector
(pin#8 V-11, 6BN8)
to generate the AGC. Simply removing the lower (grounded) .001uf, C-1104
allows much more audio to generate AGC without affecting anything else.

In my case, this makes the S-meter readings more normal, and better AGC control of signal levels.

Another change I did was to lengthen the AGC time-constant which seemed much faster than the Icom (I use it excusively in SSB mode). They used .01uf, C-901, from pin#6, V-11, 6BN8, to ground. I added an additional .05uf across it for a longer release-time.

Although the Swan-500 is usually sufficient at its higher power levels, I prefer to use mine to drive a Linear Power Amplifier. Even so, I prefer to leave a 50 ohm dummy load paralled at its output to ensure stability at light loading...the two 6LQ6's are still not working very hard and should last a long time. The dummy load does not affect the Receive sensitivity noticeably.

An Electret type element provides a high quality, low cost microphone for many purposes, including some amateur radio transceivers. They might also be referred to as a "capacitor mike". The element is small, about the size of a large pea. Radio Shack doesn't sell them anymore but several types are available from Mouser Electronics (no minimum order). My version had 5" leads, and required only +2v to +10v supply (at 1/3 milliamp). The shield on the output cable is also grounded to the case. It delivers about 140 mv P-P when capacitively coupled to a high-impedance load. A SWAN-500C has about a 1Meg input, and its microphone gain can be set at about 50%. With +6v, the electret's output is about the same as a typical Ceramic type microphone. An Electret's output is quite high fidelity, essentially flat from 100Hz to 5000Hz. (Cost $3.40 +shpg).
My contention is (at least in theory),that if you offer the full hi-fi range of audio input to the transceiver, the resulting fidelity being transmitted is virtually dictated by the response curve of the steep-skirted SSB Crystal Filter. For example, the SWAN-500C has an SSB filter 2.7 KHz wide. (i.e. 5500.3 KHz to 5503.0 KHz), and their reference crystal oscillator of 5000.0 KHz provides an ulimate audio range of 300 Hz to 3000 Hz which is quite good for voice communication. On the other hand, if an SSB filter is only 2.1 KHz wide, you must be very selective in choosing the reference crystal oscillator....you can decide whether to utilize that smaller width to emphasize low-freqency audio response, or high-frequency response, but you can't have both. You could choose 300 to 2400 Hz, OR 1000 to 3100 Hz, for example.

From: Charlie Hugg <hug-a-bug1@cox.net>
Message-ID: <YyuLf.104772$4l5.22845@dukeread05>
Source record: 13431

FS is a Palomar Engineers VLF Converter. These converters are used to allow reception of
low frequencies from 10 to 500KHzs on receivers and transceivers that don't go that low.
It is operated off of a 9 volt transistor battery and is easy to use. Below are the directions for use:

Connect an antenna to the "10-500 KHz Antenna" connector. Connect a shielded cable from the "3.5-4 MHz Out" connector to a receiver that tunes 3500-4000 KHz. Clip a 9-volt transistor battery to the leads and slip it into the holder on the converter. Turn the switch to "ON".
Tune the receiver to 3500 KHZ where a strong carrier should be heard - this is the converter local oscillator. Tune the receiver up from 3500 kHZ. The VLF signals heard will be at the dial reading less 3500 KHZ.

This converter is used and in very good condition. Price is $45 plus shipping.
Thanks, Charlie Hugg, K5MBX

SolderSmoke!
A SHOW FOR ELECTRONICS HOMEBREWERS!

http://www.ourmedia.org/node/168474

Topics discussed in SolderSmoke #16:

--EMRFD on mixers and balanced mixers
--LTSpice model for NE602
--Low output from NE602 Bal Mod circuit
--Desitin, diaper rash, and heat sinks
--REVVER web site and Trivial Electric Motor
--Solder smoke in space
--The Simpsons on social skills of Radio Shack customers (us!)

Listen at: http://www.ourmedia.org/node/168474

Background:
Tired of listening to Led Zepplin or NPR on your I-Pod? Wouldn't you like to be able to carry with you the kinds of ham radio conversations that you listen to while in your radio shack?
Mike, KL7R, in Juneau, Alaska, and Bill, M0HBR, in London, England meet regularly on the ECHOLINK system to discuss their homebrew radio projects. We are making them available as PODCASTS.

You can subscribe to the program, have them downloaded to your MP-3 player, and listen to them at your convenience. To subscribe, just cut and paste this URL into your I-poder (or similar) software.

http://www.ourmedia.org/mediarss/user/36170

If you don't have an MP3 player you can just go to the site below and listen to the latest program (and earlier editions) using the audio software on your computer.

http://www.ourmedia.org/node/168474

Here's the homepage for our show. All our programs area available here. There is also a blog and links

to some of the sites and documents we've been discussing: http://www.ourmedia.org/user/36170

We hope you enjoy the program. Please send us feedback.

From: ai7r@presenceknown.com
Message-ID: <1140788529.321258.121750@i40g2000cwc.googlegroups.com>
Source record: 13441

This is a fairly rare Drake antenna switch. It's in pretty good shape
and works. I also have a brand new, in a sealed box, motor for the
switch itself. Found a closeout on that part on the Drake site and
picked one up.

I don't have a manual.

$200 shipped to any of the 48 states.

See http://www.presenceknown.com/4sale/

Source record: 13350

Hello again - Thanks for all the responses ! I talked with an EE at work and he said just about the same thing.

I have decided to keep the microwave oven. For $33 dollars where can you find a 600 watt 2.7 gig source ??? - I have already taken out the good parts and are drilling and tappin them into a slab of aluminum. Lots of experiments are planned !!! I feel like the mad scientist in a really bad movie!

But I'm not the only one - check out this link from scientists in Israel who claimed to have an instrument made from a microwave oven than can produce balls of lightning.

http://www.livescience.com/forcesofnature/060223_ball_lightning.html

Jeeze - I have already done this (many times - some even on purpose HI HI) and I guess many of you have as well. It's called RF arcing. Still its bad form in science these days to let a little thing like facts get in the way.... after all these guys have PhD's and we hams... well...

As for me - I'm gonna create a web site showing all my mad experiments...

So when will the ARRL have a mad scientist section in the handbook??

Thanks all - Biz WDï¿½HCO

Simple one really ...

Why doesn't radio penetrate water ?

I mean the REAL reason.

I can see why it won't go through dirt - so radio in underground mines won't or should'nt work very well.

But why not water ? I know low freq will penetrate water to about 50 to 100 feet depending on its strength. Light penetrates to 200 feet.

Does it vary by frequency ? I assume it does cause water vapor and rain dows attenuate microwave signals while not effecting vhf or uhf.

Does anyome have a chart fo RF attenuation in water?

Also related - Navy did some studies in antennas. In one they noted that an antenna enclosed in water will lower the resonant frequency. Which in pactical terms means you could have a much smaller 80 meter dipole if you can enclosed it within a plastic tube of water. Believe they did the experiemnt with both fresh and sea water and the results were the same.

So... does enclose an antenna in water increase it's inductance? or capacitance ? or both?

Just curious.. - WDï¿½HCO - Biz

I'll look into the references, thanks.

TR-3 number 2 has fine 10 MHz crystals, which do not work on the top
position of TR-3 number 1. There appears to be some mojo in TR-3 #1.
It's given me a real pain to keep running, but the DX signal reports are
fine. Maybe it got offended when I patched in the DDS-60 to replace the
PTO and crystal mixer?

If I figure out what's going on, I'll post a follow-up...

73's,

Al,

Just looking through old BA messages and saw you have NC-300 Thought I'd share that imitating the NC-303 agc makes the nc-300 a pretty decent SSB receiver. One 1n914 diode from the current 6al5 to the agc bus with a 1 ufd non polar cap and about a 500 k ohm resistor. You won't believe how much better.

Does anyone have a dial stringing diagram for the Hallicrafters S-20R
that they'd be willing to share?
Working to restore a S-20R right now and have a schematic and other
documents from Bama and other sources but no dial stringing diagram.
Thanks.

This one looks as though it may be truly an additional receiver. The first "two" were obviously the same but this one has some crud on the front panel, just below the band-spread dial. He deleted the picture from the first auction almost instantaneously so that it could not be compared with the second. But.. this one may be a "real" one. I've been almost willing to bid on his stuff but have elected not to. I simply won't bid against a shill. Too bad, as some of his stuff appears really nice!

1121. TS-940 RF band pass filter alignment

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-02-28 11:22:05 UTC
From: CP <someone@somewhere.com>
Message-ID: <z4qdnZvQ-shzr5nZnZ2dnUVZ_vydnZ2d@comcast.com>
Source record: 13371

It's not quite a "real" BA but it is heavy.
I know for a fact that my radio's upper two band pass filters covering 14 MHz and up were didled by the previous owner. The 14-25 MHz sensitivity is noticeably lower than other portions of the spectrum, so since I had the radio apart for another reason, I thought I'd give this a go. I've been living with this for about 3 years now so now is the time. Reading the alignment procedure in the service manual is near useless as to which coils effect what. I've verified my misalingment with a spectrum analyzer and sweep generator combo.
Does anyone have some insight they could share on aligning this portion of the TS-940?
Thanks
Bob

1124. I want to learn about old test equipment...

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-02-28 15:40:36 UTC
From: zeitguy <zeitguy@gmail.com>
Message-ID: <1141141234.131513.59880@t39g2000cwt.googlegroups.com>
Source record: 13374

I recently bought a 1935 and a 1959 General Radio equipment catalog. I am absolutely fascinated by the old test equipment, and want to learn how it is used, and what it is used for. I have found inexpensive versions of an impedence bridge and signal tracer to practice on, but need to start somewhere. Is there a recommended text that can help a non-engineer get up to speed on these? Something like a technicians text book that steps through the theory and practice from a pretty basic level, without going deep into the theory by itself?

All replies appreciated. Thanks.

(Eventually I want to have a radio and electronics hobby workshop, and get my license.)

If I recall, there was a book on the basic use of test equipment of the ilk you're talking about. It may have been a TAB(TM)series book. They went into scopes, signal generators, tracers, grid-dip meters, and the like, at a very basic level. If no-joy with that, HP had/has a series of technical notes that discuss what you're looking for, albeit at maybe a bit higher level. The HP issuances contain general/generic information, but as you'd imagine, do reference appropriate HP test sets. Also, there are books on basic troubleshooting. I'm sure they reference the required support equipment, too.

There are also books which cover individual peices of test equipment - such as Oscilloscopes. They can be found on E-Bay for various prices and also at hamgest and some flea-markets - often for as little as a dime to as much as say $1 each. Titles such as "101 ways to use an Oscilloscope", 101 ways to use a Signal Generator", "101 ways to use a VOM"..... there may be one for the VTVM also, but you'll get the idea..... They give many instances of use.
I've got a few of them in my reference library from years back. I'm not sure how deep you want to get into electronics, but an understanding of it would certainly be a boost. Sad to say - even with a license, today - that isn't much help. WHY? Because the license manuals today give you the answers to questions - most people tend to just memorize the answers. The answers given in the text are often not enough to explain the concept. They don't go into enough detail to really be of any help. A good electronics text would serve you better. Just my two cents - and I am an examiner for both Amateur and Commercial exams.
You've taken a good first step asking here for advice. You'll get lots of it, but in the end, you'll come away with a vast knowledge of things compared to what you may have now. Good luck.

clf

Source record: 13378

Hi,

You should search out a copy of "Basic Electronic Test Instruments:
Their Operation and Use" by Rufus P. Turner (Rinehart books, 1953)

Turner was a wonderful technical writer and this book is a gem.
It consists of discussions of basic categories of test equipment,
followed by build-it-yourself projects illustrating the concepts.
Many early Heathkit test instruments are also described,
with complete schematics. The test equipment described
runs the gamut from d.c. voltmeters to a build-it-yourself Q meter
for testing coils. His chapter on bridges is especially good.

I have a 1930's vintage General Radio type 650A impedance bridge,
in its sloping wooden cabinet - a thing of beauty.

The "ARRL Radio Amateur's Handbook", published annually, is a good
place to start your studies. Any edition from the early 1950's
will have plenty of information on vintage test equipment
and methods. These ARRL Handbooks are available cheap on eBay.

Regards,
Ed Knobloch

1129. Re: Need Halli S-20R dial stringing diagram

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-02-28 18:51:34 UTC
From: Phil Nelson <philnelson@nospam.xyz>
Message-ID: <JtednVbTktQhBpnZ4p2dnA@giganews.com>
Source record: 13379

Hey, thanks for the compliment. My schematic doesn't have a stringing diagram, either, so I peeked inside my S-20R and came up with this drawing:

http://antiqueradio.org/art/temp/s20rstringingdiagram.gif

It's designed to print on a single 8.5x11 sheet. (And yes, I know I'm lousy at drawing :-)

Where it shows "so many turns" for a shaft or pulley, that means wind the string around the shaft or pulley the indicated number of times.

The strings attach through a little hole in each big pulley.

Obviously, the job will be much easier with the chassis out of the cabinet. Before you start, clean the shafts and pulleys with rubbing alcohol at the places where strings will go on them, and make sure the mechanics are properly lubricated (but don't overdo the oil).

It may look confusing at first, but should make more sense when you begin stringing.

Don't be discouraged if it takes more than one try. It's tricky to get a string exactly the right length and tension, etc., on the first shot. And nothing is more disheartening to do a perfect job of stringing, only to find that the dial is moving backward because you reversed something.

If anybody has a source for a factory diagram, I'd love to hear about it.

Regards,

Phil Nelson

Thanks to everyone for their comments and advice.

As I mentioned, I have fiddled something that works and gets me by.

These knobs are obviously very scarce and/or expensive and appear to
cost far more than my recently acquired unmodified BC-453-B for which
I was able to add a rack and dynamotor. The set now works well. I will
have to look out for another junker with a knob, which is how I found
the rack and dyno!

I found Turner's book on ABE and ordered it yesterday, after choosing among several other possible texts. Turner seems the best chance, although I got a 1940 or 43 edition, I think I will still have plenty of grist for the mill, as it were.

The GR 650A was the first GR product I saw on Ebay, and even though I don't really know what it does, it lured me into this whole fascinating area. I had to settle for a nice Heathkit '50s Impedance Bridge, and a Superior Instruments Signal Tracer and CR Bridge, as my first inexpensive tools, since the GR items were bidding up over $100 apiece, which is too steep for a whim.

I will look for the vintage ARRL, also. That is also a great tip, thanks.

1143. Re: I want to learn about old test equipment...

I like the titles, and will keep a lookout for them. The Turner book mentioned in the other post seems like a great starting point. I have a dozen or so general and introductory books on electronics, and am just returning to the hobby after doing a fair amount when my sons were in the R/C age. Now I am doing it for myself, and am interested in old radio technology and electronic musical instruments, such as the theremin, which are related in interesting ways.

I want to learn to speak the basic vocabulary of electronics fluently, rather than having to rely on "travelers phrase book" approach offered in some introductory approaches. If I need math, I have a little trig and calculus in my background, and I can grind the rust off it as necessary.

I found a code practice audio unit from the '40s in an old Ham estate. It is a single tube audio oscillator with a socket for a key and a socket for headphones. WHere do you get a good old code key? The practice unit is in amazing condition given its age. Even the gutta percha and silk insulation on the power cord is in good shape.

Thanks for the good and interesting response.

I found a recent Tektronix book on the A-Z of Oscilloscopes which was written at the appropriate level, but it talked mostly about the new digital technology. I have HP documents on the digital VOM I found, which are almost incomprehensible to me. So I know what you mean. I also have found a lot of value in the older TAB series.

The items I am interested in are pre-IC, for the most part. I want to see the pieces of the toy I am playing with. The oscilloscope I found is a Tektronix 585a, with 78 tubes and every single component is hand soldered on ceramic strips. It seems to work, after I cleaned it up a bit and learned enough to jump the Cal Out to the input on the dual trace module to watch the square wave. But it also seems to drop out or not respond consistently, and I don't know any where near enough to go beyond watching the cal out trace at the moment. I can't wait to probe my first radio circuit when I am reasonably sure I know enough to not get electrocuted.

Thanks for the reply.

The 585A is a wonderful scope. I still use one from time to time, even
though I have much better scopes at hand. The biggest problem you will
have with your scope is noise on the various pots and switches. The lubricant
on the pots and switches has long since dried up. A little deoxit on a
foam Q-tip dabbed on the contacts of the switches, on the connectors for
the plugin, and squirted in the pots will do wonders.

There is a problem in the wiring of the 585A's time delay relay that should
be checked and fixed (if necessary). If you go to:

http://www.reprise.com/host/tektronix/reference/581_relay.asp

You will find a document that details the modification, and the serial
number range it applies to:

Instrument Serial Numbers
581A 3875 - 5069
585A 5969 - 9249
RM585A 100 - 1019

If your scope is in the above range, there is a tendency for the relay
contacts to weld shut, and burn out the vertical output tubes. These
tubes are rare, and expensive, so you don't want this to happen.

Thanks for the tip. I have a note about a power supply mod that might need to be made, too. Is deoxit the same as contact cleaner? I bought a can of that two years ago for the old synthesizer I am trying to get working again. I am going to go through and clean all the tube contacts this weekend. I even found an old tube-remover tool, it looks like a kitchen tongs with rubberized tips. Hope to be able to afford a tube tester soon, but they seem to be over $50 if they are any good at all, and the prices are rising on ebay by the week.

What do you look for in a tube tester for this era of equipment?

>

[snip]

That's interesting. It looks similiar to the layout of the dial stringing diagram which came in the Hallicrafters S-40A service bulletin. The Service Bulletin dial stringing diagram is incorrect for the S-40A, which caused me a bit o' irratation.

The bandspread dial cord was broken when I got my S-40A, but I eventually got it working correctly.

I've posted a scan of the Hallicrafters S-40A dial stringing guide to the alt.binaries.pictures.radio group.

It does look similar, except the S-20R has two little guide pulleys to the left of the two big pulleys.

Restringing can be a real IQ test on occasion. Try an SX-28 some time, where the machinery is much less accessible. And in addition to the dials, there are strings to move the little band-pointer elevators up and down. I get a headache every time I remember restringing one last year.

Be sure that you put the tubes back in their original sockets.

For tektronix scopes, the best tube tester is the scope itself, and the
detailed calibration instructions. Just because a tube tests weak doesn't
mean it is incapable of performing its job... the converse is also true.

It is fairly unlikely that tube contacts will be a problem.

If you want to spend your bucks and get a tube tester, the *only* kind
worth using is a dynamic mutual conductance type. Hickok rules here.
I use a Hickok 539C... you can easily spend $400 to $500 to get a good
one. There are quite a few folks that swear by the military testers,
I177B, TV-2, TV-7 are all quite usable. The I177B was designed before
the advent of miniature tubes, and as such requires an adapter box to
test those types. The TV-2 is the bee's knees, and the TV-7 is nice too.

The emission testers are good for only one thing, and that is testing
the tube's heater, and cathode activity. Heater and cathode activity
tests can show dead tubes, but really tell you nothing about good
tubes.

Maybe you just don't understand "collecting",
Serious Heath Kit collectors want unbuilt kits.
If you don't, don't bid on it.
A built HW-8 is maybe worth $100 - $150 bucks, maybe.
The interest is in the unbuilt kit.

My 2 cents on tube testers is that they are marginally useful for everyday work unless you are heavily into restoration. I have restored many tube radios, and a dozen or so tube TVs. I own several tube testers, basically because I like old test equipment. But in the everyday world, they are only used to quickly test for dud/very weak tubes when I get in a new item.

You can test for duds by measuring continuity between the tube's filament pins with an ohmmeter. If you don't have a tube manual, you can look up the tube's basing diagram (i.e., pinout) at http://www.nostalgiaair.org/Tubes/ .

For many consumer radios, a tube that tests "maybe" on even a cheap emission-type tester will still work just fine. Why? Because those radios were made with wide design tolerances, and many of them weren't that demanding in the first place. If you replace that "maybe" tube with a brand-new one that tests "A-1" on a $1000 tester, the radio may work exactly the same as before. The only difference is that you have wasted money buying a tube you didn't need.

Some circuits in TVs and complex boatanchors will be more fussy about a tube's performance, but it sounds like you're not at the level of worrying about such things.

The best test for any tube is to try it in an actual working circuit doing the job for which it was designed. If you have some working restored radios in the house, and one of them happens to use tube type <whatever>, substitute your suspect tube type <whatever> in the right socket and turn on the radio. If the radio works, the tube is good.

Conversely, if you have a stock of known-good tubes, you can pop a type <whatever> tube into the right socket in your suspect device and see whether anything changes. If it magically improves, then your old <whatever> tube was a major problem. (This won't reveal other/multiple problems, of course.)

If you want to spend several hundred $$ for a top-end tube tester, it's your money. Keep in mind that old test equipment will always need restoration (recapping, cleaning controls, etc.), like everything else of that vintage. Plus, it may require calibration and expertise beyond simple parts replacement. If you don't already have a lot of equipment and experience, that could put you in a chicken-and-egg situation. Uh-oh, I need to buy another (reliable) tester to test things on the (probably unreliable) tester . . . .

Have fun.

What is wrong with the S-meters? If the movements are sticking, they can be repaired. Usually, it is just rust or other debris in the magnet gap rubbing on the coil.

Best Regards,

Ed

I have a drawer full of probes - not 100% sure how many "Tek" probes I may have. I'm thinking I seen a few in there. I'll look. IF I do have a Tek probe - maybe not "that" particular model. Have been wanting to thin out that drawer - so I'll take a look see. These probes are "used" - just a bunch of extras. IF you're stuck on that particular number - I may not be able to help you - but if not or anyone else for that matter who may need a probe - look me up..... I'll see if I can hook a few folks up with a probe. I have at least a couple Heath probes too - I'm not sure yet if I want to part with them. Everything has a price..... so we'll see.

Source record: 13268

Hi,

A good introduction to vacuum-tube Tek scopes is
"Oscilloscopes Selecting and Restoring a Classic"
by Stan Griffiths, W7NI (1992) (paperback, about $20)
It is a survey of Tek scopes from the beginning
through the 1960's, including your 585A.

If you go to qrz.com and "Get Callsign" W7NI,
you can get his email address.
Hopefully, Stan still has some books to sell.

I followed his troubleshooting hints,
and fixed intermittant problems in my 545.
The problem was that "Black Beauty" capacitors
in the regulated power supply had grown leaky over time.
These black tubular capacitors with color coded values
are used liberally in the regulted supplies
of the vintage Teks, and can cause strange
intermittant symptoms. I replaced all
of the the Black Beauty's with Mylar capacitors
found cheap on eBay.

I would not plunge in to working on the scope
until you are more experienced with working
around high voltage. The scope has a hefty power
supply and large storage capacitors, and can give
a painful or dangerous jolt to the unwary.

One caution: do not use regular 60-40 rosin core solder
with the Tek. That will ruin the ceramic terminal strips.
Instead, use Kester "Electronic Silver Solder"
62% tin, 36% lead, 2% silver.

73,
Ed Knobloch

I have checked with the local shipping service.

Shipping via FEDX will be between $150 and $200 to most address on the US mainland.

I have seen Marauders not meet the reserve on Ebay at over $150 plus shipping.

I will sell this one for $100 plus the actual shipping cost charged by the local shipping store.

Thanks for reading Jim N6PJQ AT Hotmail

> A built HW-8 is maybe worth $100 - $150 bucks, maybe.
> The interest is in the unbuilt kit.

Problem is it isn't an "unbuilt" kit! It is partially assembled, and there are problems such as the cracked knob, no original box, stained manual, and some scratches. hardly cherry.

I think I understand collecting enough to know that this partially assembled kit wasn't worth over 700 bucks - If I'm going to spend that much, it will be pristine.

Source record: 13273

I use the 2000 on mars frequencies, but the internal ATU will not go there for me. I've heard rumors that some do, but mine dose not. I have a fairly early TSB-2000. I use a LDG AT-100 Pro tuner and it is great. Fully automatic, you don't even need to use the tune button. Just set the tuner to auto mode and key up. If SWR is over your preset value, the tuner automatically initiates a tune cycle and tunes in a half second or so. The radio automatically drops transmit power if the SWR is too high at start, and it goes back to your full power setting when the SWR comes down. Don't waste money on the LDG Kenwood interface, though, mine has never worked properly.
callsign at arrl.net is good for email.

1177. New program CONNECT

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-03-03 02:07:55 UTC
From: Reg Edwards <g4fgq.regp@ZZZbtinternet.com>
Message-ID: <du88dr$d4i$1@nwrdmz03.dmz.ncs.ea.ibs-infra.bt.com>
Source record: 13277

There have been recent discussions about the interchangeability of coaxial plugs and sockets, their dimensions and their impedances. But, as usual, the magnitude of the electrical effects is never mentioned. Without numbers nobody knows what they are talking about.

A coaxial connector is a very short length of transmission line but at UHF and microwave frequencies it is an appreciable fraction of a wavelength. When 1/4-wavelength long it has the property of transforming a mismatched termination to another value. When 1/2-wavelength long the input impedance repeats the value of the termination. The SWR on an adjacent line is a function of the input impedance.

What is the effect of using a 75-ohm coaxial connector in a 50-ohm system?

What is the effect of using a length of transmission line of 50-ohms nominal impedance when it is actually 53 ohms?

With mixed values of line Zo at what high frequency does the SWR and reflection loss become excessive?

Program CONNECT.exe calculates the effect of inserting a length of line in a system of different Zo. Differences can be large or small. Line length can be physically very short.

For a given frequency, mismatched Zo's and a velocity factor, input impedance, SWR, reflection coefficient and reflection loss are calculated. (Reflection loss is sometime known as mismatch loss).

The program is worded in terms of a connector mismatch but has other applications.

Input data can be varied in small increments from the keyboard while observing the effects on calculated values. Download CONNECT from website below. It has entertainment, educationaal and practical value. Amuse yourselves!

Or Mouser? The modern carbon film resistors don't go nutty like the old carbon composition ones. You can still get carbon comp at Mouser, and pay a premium, if thats what you are asking.

Check visually to make sure it isn't splined. It may not
require a splined wrench rather than a hex (allen) wrench.
Splined wrenches should be available at most electronics
suppliers.

Thanks Al for a terrific recommendation! I also appreciated the other responses, however, it felt like I might have trampled on some feelings by daring pose my question on this newsgroup. Evidentally Digi-Key should have been as instinctive to me as a cat licking its kittens.

Anyway, Radio Daze is perfect, has exactly what I need, fresh stock and, just as important to me, does not seem to play all the games with excessive minimum orders and bogus add on charges. In fact, they state emphatically they charge only actual shipping cost.
I prefer to throw my business to companies like that as I have grown tired of the corporate charlatans who feel we as customers have no choice but to let them treat us in any way they can.

Thanks again, Al.

Now I am not an IT professional mind you but I used test files with the scr extension as "SCRipt" files. The operating system likes to grab them and just do as the text inside instructs it. I use OE and it would reject such files if I set it up to but being a curious fellow, I like to see what I am missing.

Then you should like Mouser. They have no minimum, and charge only actual shipping costs. If you use UPS, or FedEX ground shipping, there is no extra charge when they ship backorders. They do have one small added fee for tiny orders: they add $5 for handling on orders under $25.

As a further benefit, their prices are almost always significantly under DigiKey.

I use them for 99% of the parts orders needed by my business.

I am also using the AT100 Pro. Excellent tuner! I also go outside the ham bands with mine to authorized frequencies and it tunes easily to any of them. I've never heard of one that had issues turning, or worked improperly, on any HF frequency except 6 Meters. But then, that would be stretching things a bit, eh, anyway! :)

The .scr is usually the screen saver program extentions. They are exicutable programs just like the .exe programs. They can take over the computer and do almost anything. Good way to pass on a virus or worm or anything if the programmer does not want to really use them as a screen saver.

do you have some pics? I "think" I may have some but it's been so long since I stripped them down I can't recall. I ask for the pics because as you know - one person's idea of antenna binding posts may be a tad different than others - for example. I want to get you the "exact" parts if I have them. I had a couple complete set ups at one time which I stripped down. I've since sold most of the coil forms and some miscellaneous. But I THINK I still have some other stuff in my junk boxes. I just need to match them to your needs.

Source record: 13299

Hi,
A bit off topic but I figure maybe someone in here might be able to help.

Have the need to put together a generator. Have a cat 3208 motor and allison automatic with a pto output. The motor is the drive engine for a large boat(stern wheel boat, 65 foot). I want to drive the gen head with the pto through hydraulic pump, flow control valve, hydraulic motor to the head. The head is a 12kw that needs 22 hp at 1800 rpm to run at full load. The motor will run from idle to aprox 1000 to 1100 rpm for cruise speed. Have plenty of extra hp to run the genset, only need aprox 85 hp to run boat at cruise speed. The cat is rated at 225 hp. Would like to have some spare hydraulic umph to also run a hydraulic controlled rudders. Won't take much for that. Need to know what pump/motor/flowcontrol configuration I should look for to make this work. Also, the pto unit has an air operated engage unit and the genhead I was looking at has a field disconnect that could be coupled to the tach to disconnect if rpm to low to drive the motor at the needed 1800 rpm. I am pretty mechanically inclined and have no problem working on anything, just don't have much experience with hydraulics and don't want to reinvent the wheel if I don't have to. Any help would be appreciated.
Thanks
Mike

How bad is it? As I recall, these are cheap permanent magnet motors. If it cannot be turned by hand, try greasing both bearings with a light turbine oil and trying to free up the shaft.

The next thing that goes wrong with them is the brushes wear out. You can usually arrange transplants from other DC motors.

If the armature or field coil is bad, it's trash.

I have seen 3-500Z tubes mounted in the johnson ceramic sockets. The Heath SB-220 uses them.
Will the 4-400 tube handle the airflow the same way? Usually you see the air system sockets used so that the air will flow up through the bottom. Will the filament connections remain solid in a 275 ceramic socket with a muffin fan blowing across the tube?
? I have seen the sockets raised a bit so that the filaments get cooling. Just wondering if the 4-400 would work that way as well? Any experience with this?

I gather you want output from a single-ended audio stage, driving a
push-pull pair with a CT secondary?

Since you don't need to sink the sort of current that you would with
plate modulation, you can get by with just about any small low-ratio
transformer that can handle the DC. Maybe even a cheap repeat coil.

Or am I off-base with this?

I have checked with the local shipping service.

Shipping via FEDX will be between $150 and $200 to most address on the US mainland.

I have seen Marauders not meet the reserve on Ebay at over $150 plus shipping.

I will sell this one for $100 plus the actual shipping cost charged by the local shipping store.

Following quote is lifted from Symantec [Norton Antivirus], edited only for
brevity:

< quote>
Symantec Security Response encourages all users and administrators to adhere
to the following basic security "best practices":

* Configure your email server to block or remove email that contains
file attachments that are commonly used to spread viruses, such as .vbs,
.bat, .exe, .pif and .scr files.
<end quote>

If you wonder what you're missing in scr files, you could be a mite too
curious.

==========
During the late 1970s ,the old 405 lines TV system in the UK operating
in Band 1 (approx 45 -65 MHz) was decommissioned and some equipment
landed at junk sales held at radio clubs . I managed to obtain two 1 kW
amplifier racks (out of 7 released from a local 7 kW TV repeater)

The rack had 2 QY4-400 (tetrode)valves with the (flat,ceramic) sockets
fitted approx 12 mm below the chassis on stand-offs . The space under
the chassis was fully enclosed (almost air -tight) and was fitted with a
pressure switch (with a large diaphragm to sense and switch a low pressure).
A centrigugal fan blew air under the chassis which escaped via the valve
socket openings thus cooling the valves. There were no valve 'chimneys'

Upon fan failure the pressure switch would initiate the rack's shutdown.

A simple but effective way of cooling the valves.

I don't think they are thinking the same way you are. By shipping their catalog to anybody, and everybody that wants one, they are generating a lot of good will. Small buyers sometimes become big buyers (think students), and sometimes not. But happy customers always talk. I've been a happy customer of Mouser's for 20 years. I've turned a lot of my customers into Mouser customers. For me, the other companies are only there to fill in the occasional hole in Mouser's stock.

Hello All,

I once heard there was a ham in Tigard that could repair the old Drakes. Anyone know who I'm talking about?

Meanwhile, I have an R-4C whose PTO is drifting around, I'd say +/- .5KHz while listening to CW. Of course I can use the TX-4C's PTO, but I can't work split. :) If someone has some quick checks to help me narrow the problem I'd appreciate it. Both rigs were not long ago gone through by John Kriner, btw, but the PTO problem cropped up after only several hours of operating.

tnx es 73,

A long time ago, I took a course in photography, and the instructor said that to gain a fresh perspective on a scene, look up, look down, get lower, get higher, do anything rather than look at in the same old way...

In your case, look down on the bottom of the case, and you will see a nice pretty chrome plated screw, with protection washer that keeps the heavy transformer from dishing out the front panel. Remove that screw.

Doug, Here's what I remember from several RCA and Collins Broadcast transmitters and a KW amp I built: Those ceramic sockets SHOULD have holes in them of about 1/2" diameter. Line up a 4-400A with the socket. Notice that the BASE of the 4-400A has holes that line up with the socket holes. Notice that the 4-400A has a metal base which has a series of holes around it. It's very important to put lots of air thru those holes to flow around the tube base pins. If you're going to run lots of dissipation (definite color on plate) then the usual approach is to mount the socket just below the chassis on standoffs or about 3/16 to 1/4" as I recall. THe SIZE of the hole in the chassis then is set to have about 3/16 to 1/4" of space around the outside of the metal tube base, so there is additional airflow which will hopefully stay fairly laminar around the upper part of the tube envelope. NOTE: Normally that metal base ring is grounded by several metal clips.

SOME systems used the "Air System Chimney" (A pyrex glass open-topped "bottle" around the tube) to direct the air around the tube envelope, although 1000W OUT Broadcast transmitters from Collins and RCA did not use them, and their high level modulators put out 750 watts of audio, at, say, 50 percent efficiency, so there was about 375 watts of plate dissipation per 4-400A at 100% sinewave modulation. Which at one time was OK, because the actual duty cycle on "Typical Program Material" was much lower. But about 1970, as I recall, watching the plate color during "Magic Carpet Ride" by Steppenwolf, with an asymetrical limiter, 20 db of syllable-rate compression, plus the pre-processing of the airplay cart by a demented Program Director, the plates looked a lot like 100% modulation during an Audio Proof of Performance test :-)

I'm working on a Hallicrafters S-38 and have already recapped the radio and even changed a few resistors that measured a bit high. I receive loads of stations on the standard broadcast band, but the radio is not nearly as sensitive on bands 2, 3, and 4. Anyone have some help with this one? Perhaps an alignment would do the trick? Or is there something else? Any help would be appreciated. Thanks.

Hi,
Given the age of the unit, and that you have already had to replace a few components that had changed value, an alignment would probably be in order. Try the better antenna first and if your happy with the sensitivity than don't worry about it. I myself would do the alignment just to be sure.

Good Luck,
RoD

I am in the process of restoring two S-38's, a B and C model, in fact
just got through painting the case and starting to clean the chassis.
The radio has been recapped, but needs a new power cord. Should you
replace old cloth covered wires with modern wires also? I am new to
this so pardon my ignorance of the radios. I used to have one when I
was in jr. high and high school and wanted one for the nostalgia.
What else should one look for on the chassis to replace or
clean/replace?
Thanks

Cloth covered wiring is fine. I try not to replace things unless there will be an improvement. Power cords can be unsafe, but the cloth usually does not deteriorate.

Once caution about using an S-38 in the basement. Remember the chassis is ac-dc and there can be some conduction through the floor. More than one amateur has been killed working in a basement, when insulation failed. One of the league's heavy hitters was killed in the 30's when his ac transformer shorted out to a chassis and he became the path to ground.

A GFI would be a good investment in a basement when working with the old gear.

Or isolation transformer. And carefully inspect the rubber washers that insulate the chassis from the cabinet. If they are degraded, you can get a shock from the metal cabinet, which is now connected to your power line. Fortunately, they are easily replaced (check the plumbing supply department at your local hardware store).

More info about safely operating a "hot chassis" radio can be found at http://antiqueradio.org/safety.htm .

The GFI breaker in my basement shop drives me nuts. The power line
filters in my test equipment trip it from time to time. Remember
that the typical power line filter looks like this:

```
LINE --------+--RFC--+-------------> to Load
| |
~120V CAP A CAP A
| |
BOND---------+-------+---Chassis GND
| |
~0v CAP B CAP B
| |
NEUT---------+--RFC--+-------------> to Load
```

The current through the capacitors marked "CAP A"
is vastly more than the current through the capacitors
marked "CAP B". This results in an imbalance in the
current between line and neutral... just the sort of
thing a GFI is looking for.

One filter is no problem, but when you have a dozen
or so on a bench circuit, it is marginal. If there
is a burst of electrical noise on the same side of the
pole pig, such as might be caused by running a high HP
universal motor, the GFI will trip.

I would rather rely on proper wiring of the bond wires
for protection... that, and good rubber soled shoes.

>The GFI breaker in my basement shop drives me nuts.

Yes, they can be a pain in the ... But better that than something shocking. The isolation transformer is a good idea, although the ham I mentioned about from the 30's was killed in a transformer operated rig, when the ac shorted out to ground in the transformer.

Construction of a small box with a GFI outlet to only power a few items such as the S-38 might be one alternate approach.

When in high school, I got my hand across a 1500 volt power supply and was picked up and thrown across the room and knocked the doors off my closet. I was dazed but unhurt. It knocked sense into me, and I have been afraid of high voltage ever since. I now short things out two or three times before working on high voltage and then still do not trust it. I have now gotten to be pst middle age without any further shocking developments.

An isolation transformer is a good thing, but if you want to use one, you
need to ground something to make it a safe thing. Leakage in the run of the
mill transformer is uneven from one side of the secondary winding to the other.
It has to do with the winding mostly progressing from inside the core outward.

Back when I was a teen aged engineer, I built a nice regulated HV supply.
I (for reasons that elude me now) made the supply with the HV side isolated
from ground... I think I wanted to be able to go negative WRT gnd if necessary.
My bench was powered by a 2 wire extension cord... no bond wire.

Well, I didn't think some things out quite carefully enough. I had the filter
caps clamped to the chassis. The filter caps guts were isolated from their
aluminum can, and I didn't check to see how good of a job they did with the
isolation. One of the caps developed a short from its + terminal to the
aluminum case... putting the chassis of the supply at +800V above the - terminal,
which was chassis ground on the transceiver I was testing... I was tuning
the rig up, and I had my right hand resting on its chassis, with a diddle
stick stuck somewhere, when I smelled something hot. So I reached over with
my left hand to flip the metal handled power switch on the

p__o__w__e__r____s__u__p__p__l__y...

The 800VDC arm-to-arm caused a violent muscle contraction, and I threw myself
back about 8 feet into a cement block wall. OUCH! Apparently, I did wake up
afterwards....

I don't isolate *anything* anymore. It gets grounded period.

Thanks for your offer to help, OM. Yours is only the third
response I've gotten to my request (sad, eh?). A gentleman
in Wisconsin was able to supply me all of the parts I needed
for just the postage cost (I'm going to force him to accept
some money for the parts, however!).

Thanks and 73,
Dean K5DH

No problem, you're quite welcome. Just hope you understood, I have
"forgotten" what those parts looked like exactly, so I wanted to be able to
match them. While most "antenna posts" may look the same - a dial glass
won't. At any rate, glad to hear you got your supply. As to these parts,
many times I strip things down and sell the parts dirt cheap. I don't look
to get rich off any one part - I "try" to offer a decent price for folks
like you to do what we do. Hey, I scrounge too for parts to do projects! If
I don't have it - I have to go look too. I love homebrewing myself and doing
Tube type Ham and CB rigs (leisure and repair).

Yeah, I know about basements and too much electricity. When I was a kid, I learned that if I played my electric guitar in the basement, I needed to wear shoes. Without shoes, just touching the strings on the guitar connected to my amp resulted in quite a shock. Same thing happened when working on the S-38. I always wear shoes when working with electricity in my basement. And I use one just one hand, keeping the other in my pocket. Anyway, still trying to track down why one radio is more sensitive than the other. Perhaps some of the tubes need to be replaced. After replacing questionable resistors, there has been no change.

1247. FYI - positive crystal vendor experience "plug"

I had the occasion today to look for a 38.660 Mhz crystal for a Hamarlund HX50. So I called ICM http://www.icmfg.com/contact.html and pushed "0" to get around the button madness. A "receptionist" answered and I asked for help in ordering a proper crystal. The conversation went something like this:

She questioned me at to what it was for. I said an oscillator.

This receptionist began to ask deeper and deeper questions. Until I told her it was for a Hammarlund HX50 Heterodyne oscillator.

She said, "Let me see.....what frequency do you need?"

"38.660 MHz"

"MMmm that is a third harmonic......", "Yes we have that Hammarlund HX-50 crystal. It is a third harmonic and is $19.95 and can ship on March 28th."

"You don't sound like a receptionist to me. "

"We dont have one. I am in sales........25 years........."

They apparently handle and welcome armature radio crystal orders. I could have sent the engineering department an oscillator circuit (but they already had the HX-50 documentation and many more) so they could help select a proper crystal.

Now I am no crystal oscillator expert. So I greatly appreciate this companies friendly help! If this crystal restores the output of the heterodyne oscillator to its former frequency and amplitude I will be ordering more.

If you call ask for Barbara ex249 and mention you saw this. No, I get no remuneration of any kind. This was just a very welcome and timely experience!!

Paul -

This is the normal positive experience that I have always had with ICM. I talked to Barb a couple of moths ago for an order of several crystals.
I made a mistake on one (transposed the numbers) I quoted over the telephone.
I sent an e-mail that evening (during holidays) ...
crystals arrived on time -- and were all correct (they handled the correction - no problem)

This is a perfect example of qualified and well trained personnel -- tell me you get that from other US companies? -- it is "old school" and rare these days -- but the best companies know the value -- and smart customers know that you may pay a bit more for it - but are happy with it - and return for business !

I've dealt with ICM since I started playing with FM and repeaters back in the mid 60s. They've always gone the extra mile, and they deliver a quality product. I remember when they sold small module kits for hobbyists and hams--oscillators, mixers, RFA boards... I hope they are around for the next 40 years. Good, friendly companies are hard to find, and they always treated small customers with respect.

Swap tubes one at a time starting with the one closest to the
antenna circuit and see if the sensitivity 'moves' with one of the
tube swaps.
I have to admit it's not totally my original idea. Go here, scroll

Fred, I have had good luck at the local auto paint store,take the radio to the paint store ,sit it on the counter.They will scan it with their magic machine,come up with a code number,mix a pint or sometimes 1/2 pint of paint. If you do not have a compressor and paint gun ,they can sell you a Preval spray paint system .It comes with a pressure can,bottle and valve assembly..works like a professional system..Preval system is not expensive and can be used over and over..Mixed paint is not cheap ,You will also need a can of reducer,they sell that too..about $15.00/$20.00 will paint several Boatanchors. I little care in cleaning and preparing the surfaces and applying the paint will usually get you a nice ,acceptable job..Good Luck W4PQW

Swapping tubes with the sensitive s-38 was also a good suggestion. Make
sure the contacts on your bandswitch are clean.

Thanks Chuck for the info on Mouser. Years ago...late 1970s...I bought from them but was dissatisfied with the transaction for some reasom (which I can no longer remember why). I'll take you up on the recommendation. Yesterday I drove 3 hours to what once was a great little electronics store in a town I used to live. The store had been renovated and was now owned by Marsh Electronics and was a big waste of a trip. I guess they all want us to throw this wonderful vintage gear away and buy the cheap crap coming from China. Anyway, onward to Mouser...
Thanks for taking the time to reply.

Hi Smokey,

Quite a few years ago, Mouser decided to stop being
a surplus, and overrun parts store. They put on suits, and
got a real accounting system, real inventory control,
and real suppliers. They have had their moments, but
over the last 10 years, they have been dead reliable.
Everything they sell now is brand new, and good quality.

-Chuck

1260. Alignment procedure for S-38

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-03-08 18:24:45 UTC
From: Rod <rsievers@siu.edu>
Message-ID: <1141842285.365587.284650@e56g2000cwe.googlegroups.com>
Source record: 13210

OK, time to start a new topic. I'm now tryign to align my S-38s and I have some questions. I have an RF generator and its working fine. Do I need a VTVM to connect to the speaker pins? Or will any multi-meter type instrument work? Is it ACV that needs to be measured? Also, the S-38 alignment instructions says when aligning the 455kc section to connect the hot lead to the "stator plates of the rear section of the tuning gang." Now, I know what the tuning gang is, at least I think I do, but what are the stator plates? Any help on these questions would sure help out someone who's learned a lot with his first boatanchor restoration, but needs to know a bit more.
Thanks, Rod

Probably any old multimeter will work fine for speaker output; it's
the AGC lines and suchlike that really want zillion-Ohm-per-Volt
meters. At the speaker pins, you'll be measuring ACV.

The stator is the set of plates that doesn't move, that is
_stat_ionary, hence _stat_or.

Good luck, and thanks for asking!

Source record: 13212

The new digital volt meters are high enough impedance to replace the vtvm in most tuning applications, although they are a bit more finicky to tune with. But if you are slow and methodical, it will work fine. The vtvm needs to be pulled down off the shelf and plugged in.

The plates of the capacitor are the rotor and stator. The rotor is grounded through the shaft.

It is possible, especially n the higher frequencies to align the mixer to the image, which is 910 kHz away.

Good luck. When you are finished, have a cold 807.

73, Colin K7FM

The stator plates are the plates that do not move. I strongly suggest
that you find somebody locally who can guide you around before you
start poking among those voltages.

I'll second KC1XF's comments. I use McHenry Auto Parts, here in Frederick, MD. They have an excellent color densitometer and can match all but the most exotic finishes. They, and hopefully your paint dealer, can batch up spray cans for you. From experience, I'd recommend you letting the dealer do it for you! Additionally, they should have automotive paint chip books that you can use to match your paint. If they are truly a pro shop, they'll also have the Fedstrip and Milstrip paint chip books. I use these to specifically match up the various OD and gray paints I use for military equipment. Just find the right shop; they'll be up to the task.

de K3HVG

PS: Do your comparisons under proper lighting! Indoors, under fluorescent lighting, can be deceiving.

From: Rob Mills <robmills@cox.net>
Message-ID: <FoIPf.489285$0l5.130383@dukeread06>
Source record: 13216

I just acquired an R-4b (serial # 9737C) and it has a 1/4 phone jack between the RF gain knob and AVC switch. Don't see this jack in any info that I can locate.The receiver has been stored un-used since being re-caped and etc by drake just before drake quit taking in and rebuilding things, probably 8 or 9 years ago. Would drake have added something? The relative who owned it was not inclined to modify equipment. RM~

PS, No I haven't opened it up or fired it up yet, just un-boxed and studying things.

Although I don't have an R4B (2 R-4C's, though) I'm looking at several front panel pictures of the R4B. It appears to me that, just like on the T4XC, there's a small dot on the screened front panel where the mic jack would have been punched as on previous models. On the T4XC model, they moved the mic jack to the rear panel, owing to the crowded conditions behind the front panel. One might assume, then, that a similar condition existed on the R4B but a previous owner may have none the less simply moved/installed (in this case) a phone jack on the panel for convenience. The same thing can be done to the T4XC, but its a tight fit, inside!

>
> Doug N4IJ
>
>
I built a linear using two 4-400's. I used the Johnson ceramic
sockets (square type) that did have some holes which lined up
with the ones in the bottom of the tubes. I mounted the sockets
under the chassis FLUSH with the bottom of the chassis. I pressurized
the chassis with a 4" boxer type fan mounted under the tube sockets.
This fan was one of the high speed types that could move lots of air.
I also mounted a pair of the same type of fans next to the
bottles on the top of the chassis, blowing air from outside
into the chassis past the tubes. The air flow went through the base holes
and around the glass bottle. This is similar to the way the
SB220 linear was build, as with many HB amps. The tubes did not
suffer any heat effects, while the pair ran near the legal limit.

BTW, 4-400's work ok in GG, but they like more HV than their triode
counterparts. While a pair of 3-500's work well with 2500v, the 4-400
likes more like 3300-3500v to get the same output and IM figures.
So your tank circuit will have more "L" and less "C".

Doug, a suggestion about "Longevity" for 4-400's (Actually, any thoriated-tungsten filament power tubes):

These tubes are very sensitive to filament voltage. Make sure the tube pins and socket are nice and clean and shiny (don't use any abrasives!).. Measure filament voltage at the socket. This is all to make sure the tubes REALLY get the correct filament voltage to the filament... It's 28 Amps for two tubes!

Tubes that are new or in good condition do NOT need the full rated filament voltage for full output. But if you do not have good AC line regulation at your location, it's hard to get it exactly right.

In Broadcast use, I modified some RCA and Collins transmitters by adding a "Sola" type voltage regulator on the AC line, and an adjustable autotransformer ("Variac" or "Powerstat") to feed the filament transformer. With all new tubes, I could measure the distortion percentage on the transmitted audio, and lower the filament voltage until the distortion just started to creep up. And set a little margin. As I recall, a 5.0V tube would initially run fine at 4.6 to 4.7V. On one transmitter, the tube life went from 4000 hours to over 9000 hours (a year, 24-7). Of course, the filament voltage was slowly raised, and the tubes were 'retired' when the filament voltage for low distortion got up above 5.0 volts. In noncommercial service, you could get some retired 4-400a's to work for another 1000 hours or more by raising the voltage to 5.1 or 5.2

-- Plenty of air
-- Clean bright tube pins and sockets
-- Minimum required filament voltage

were the main considerations.

Have fun!

I just recently restored an NC-300. The front panel was in very good
shape (just a couple little chips in the paint), so I didn't need to do
too much with that. I just mixed a couple gray paints together and
touched up the spots with a Q-tip.

For the gray on the cabinet, I found a can of light gray paint at Home
Depot or Walmart (I forgot which one), that was very close. It was just
a bit lighter, but not much.

Sometimes you find out dark secrets about friends or relatives who are passed on, when you go through their stuff. Perhaps your brother in law was one of those who put holes in perfectly nice panels. I have learned darker secrets about relatives.

Morning Colin,

I hear that! I did open it up last night and it was an additional phone jack and there was a factory made square hole in the chassis (copper plating covered the edges of that hole) to clear the jack and the jack was neatly installed. I plugged it in and everything seemed to be working as it should but am going to pick up a can of deoxit this afternoon and do some cleaning. After looking at some of the switches I have decided that only the transmitter was returned to drake to be gone through and it looks new inside and out, wish it was the receiver that had gone back as I have no use for the xmiter. Later, RM~

Fred,

I am also restoring a NC-300 and found a web site that suggested
using some shades of Testor's model paint that are a perfect match.
Try Testor's FS36307 (Light Sea Gray) and FS36081 (Euro 1 Gray) for
the two shades.
For the life of me, I can't find the site's address. It is out
there, somewhere.
Anyway, for a little moral support see:
http://www.virhistory.com/ham/nc300/nc300.html
for color schemes for various serial numbers of the 300.

Is the signal modulated? If so, you can just use your ears and listen to the output from the speaker. A meter is more precise, but not much more. I usually use an unmodulated signal and measure the AVC voltage with a high impedance meter.

There's not much RF selectivity in an S-38 and you can simply inject the 455 kHz signal using the radio's antenna terminals.

Message-ID: <%G%Pf.35677$_S7.19924@newssvr14.news.prodigy.com>
Source record: 13231

I recently ran across a Clegg 22er am/fm. A web search turned up the original Clegg 22er (AM only), the 22er II (?) --presumably also AM only and a Clegg 22 FM. None of these seem to do both AM and FM.

However, the one I have is marked "am/fm" and the front panel controls seem to indicate it is capable of either.

Is this somewhat scarce? Maybe a prototype? Any Clegg collectors out there that might be interested (or are they-the collectors, that is-pretty scarce?)

73,
Carter K8VT

Carter,

Towards the end of AM era, many VHF transceivers were converted to
transmit FM using varacter diodes. It worked surprisingly well, but
required "slope detection" of the received signals, i.e., using an AM
receiver to tune the FM signal onto the skirts of the IF filters, thus
converting FM directly to AM.

If your unit is a prototype, the receiver will probably have both
product and ratio detectors, i.e., it will be a "true" FM receiver. If
there's no FM receiver, I'd guess it's a homebrew conversion.

FWIW.

William

William,
Thanks for the thoughts...

BTW, one thing I should have mentioned is that the factory silk
screening right on the front panel says "Clegg
22'er AM/FM" so it seems unlikely that it is homebrew... and a web
search has, so far, not turned up anything with that name/labeling.

No, I'm sorry to say that I do not have the manual...and that is what prompted this whole quest. When I went to do web research to find a manual, nothing showed up. That's why I almost suspected a prototype or possibly Clegg's last gasp--a rig that just barely got to market before they went under???

Sorry, I forgot to ask this in my previous response...

Can you refer me to any Clegg web sites?

Also, what, if any, was the tie-in between Clegg and Squires Sanders? I always thought of Clegg as V/UHF and SS as HF.

Carter K8VT

P.S. As you seem knowledgeable about Clegg, would you like me to email you a picture of it?

Yes, I would like a picture. I'm on dial up- so be gentle.
I think SS bought Clegg in their latter years. Seem to also recall that SS
had at least one CB transceiver.

This tester was rebuilt and calibrated in January, 2005 by the late Chris Haedt who was considered by many to be the "Professor of Tube Testers."

It is a late model 667 without the built in roll chart, has a full manual copy and repair report and calibration sheet from Chris.

Extremely clean, no longer needed here as I have cleaned out the boatanchors. It will not test the older 4 pin tubes.

This is a solid state unit and very reliable. It is a dynamic conductance tester.

$100 plus shipping/insurance.

Les Locklear

>I have a 666. What's to calibrate?

Two pots inside, with a VOM across the AC primary transformer tap and set to 130VAC with the line-adjust pot. One pot is then set to full meter deflection (adjacent to the filament selector switch), the other to 1/2 meter deflection (adjacent to the line-adjust pot) with various buttons pushed. Takes 10 minutes apart from removal and installation into the case. Did mine last night.

Does not have sockets for pre-octal tubes, but does run well up into the compactrons and nuvistors. And it lists a lot of the pre-octals on the chart, so there must be adaptors available. Calls itself a "dynamic conductance" tester. Weight is about 12 pounds, or so. Not overly large. Good, easy-to-read meter and very easy-to-roll tube chart. Eico has a reputation for errors on its early tube charts, BTW.

Now to trace a niggly little fault, and intermittent to boot... the worst kind. I expect it is a bad connection combined with a wire-or-two out of place so that the problem only shows on occasion.

If I get it fixed, this one will go at Kutztown. I snagged it as the price was right, but it is not a keeper... and of the three I have, it is the least appealing. The other two do the older tubes as well.

> with this?

My recollection from Eimac tube spec sheets is that there must be forced-air directed upwards from the non-tube side of the tube socket and there are specifications for flow rate and pressure. Both the 3-500 and 4-400 (100 watts less plate dissipation) call for 5 v at 15 amps (IIRC) on the filament and that is a lot of heat. I don't know if the 3-500 is pushed closer to the limits on this but Eimac made a special socket (and chimney) for the 4-400 but many ARRL handbook amplifiers went for a much simpler socket. And, the Johnson Thunderbolt (I had two of them at one time) used a simple ceramic socket plus an under-chassis phonograph motor type of fan to blow air up from the bottom as well as an above chassis fan motor to blow more air around the pair of 4-400s for a 1 KW DC plate input level (with dull red cherry glow on cw carrier and a little less glow on SSB voice).

Beyond that, if you are thinking of running 4-400s instead of the 3-500z, you also need to worry about bias voltage a little and you would have to resolder the socket pins because the 3-500 is a triode and the 4-400 is a tetrode (need to ground the screen, as well as control grid). But I have run 4-400s in GG in a homebrew amp in the past.

~~~~~~
"Flow rate and pressure" are nice, but the *only* important thing is the temperature of the tube at various points as specified by the tube manufacturer. If you are serious about proper tube cooling, use either a non-contact thermometer of some kind or thermally-sensitive paint to ensure your tube is within temp specs. Flow rate and pressure are a means to an end, not an end in themselves.

Actually in amateur service filament voltage is not that big a worry. I think the excessive worry comes as a carryover from BC service where tubes are operated far below ratings and can be operated for almost 9000 hours per year.

In BC service, excessive voltage shows up in a noticable period of time since the tubes are operated 24/7. The voltages and currents of other elements are a much lower percentage of maximum compared to amateur service, and filaments are not cycled. As such, emission failures are a common failure mechanism.

In amateur service, it takes many years and thousands of fialment cycles to accumalate the hours a BC tube sees in one year. Tubes in amateur service much more often fail from seal leakage, element structure defects, and occasional abuse.

Out of hundreds of tubes I've seen fail in amateur service over the past 30 years, I can count the number of emission failures on my two hands.

I'm not saying filaments should be run extra hot, but I am trying to point out what worries BC stations is often not a concern in amateur use.

By the way, two of the emission failures I saw were in 8877 tubes that were operated too cold. The owners had reduced filament voltage below 4.75 volts. NEVER run a MOX cathode tube at reduced voltage unless you also plan to limit peak emission current.

My advice is to run all tubes in amateur service at RATED filament voltage or in the allowable tolerance range for voltage.

As for cooling, seal cooling is critical in glass tubes. So is periodic operation to keep the tubes gettered.

Ron,

Did the 22'er FM have an FM receiver, or was it only an FM transmitter
with an AM (slope detection) receiver?

1311. More R-4b questions

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-03-12 06:02:33 UTC
From: Rob Mills <robmills@cox.net>
Message-ID: <VPOQf.499212$0l5.105804@dukeread06>
Source record: 13111

I downloaded a manual from BAMA for an R-4b but find quite a bit of difference from the 4b in the BAMA manual and the one I have. The BAMA version has 10 tubes and mine has 9. I suspect mine is more of a hybrid version and has a serial number of 9737C.
Any Drake gurus out there that can point me to a source for the correct manual/schematic for my 9 tuber with the above serial number?

Thanks for reading, Rob Mills

PS, I also have an additional jack with factory marking "spare", The BAMA version shows an un-marked empty hole there.

1312. WWII FT243 Crystal Manufacturers

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-03-12 13:17:42 UTC

Hi,

Yesterday I bought a 'BOX BX-49-A' (coil/crystal set for the
BC-611 walkie-talkie) with a view to starting a crystal
collection. It contained 24 FT243 rocks from eight different WWII
manufacturers. Just to get an idea of the task ahead, has anyone
compiled a list of these manufacturers from that period?

The few I have so far are marked -

Univ K.C. Telev M.O.
Valpey Crystal
Turner Company, Cedar Rapids
Scientific Radio Prod.
RS MC
Camb Thermionic, Camb Mass
Gentleman Products, Omaha
H.I. Inc
Stand. Piezo
M.P. CO.

TIA - Joe (G3LLV)

If oversize filament transformers are used (never know what kind of
surplus junk hams use!) there is a danger of filament failure
due to starting in-rush current. My home brew linear started these
tubes up with a power resistor in series with the primary of the
filament transformer for a few seconds, which was then shorted out
by a relay. A transistor r/c delay circuit did the dirty work.
This lets the tube filaments preheat a bit before applying full
voltage.

Hi, Tom

Thanks for the hint about gas in large glass tubes.
Also thanks for the link to your web site, plenty of wonderful info!

One question please - I have 8 type 3-500Z which
have not been used for 20 years. You mentioned operating
them at low plate voltage and positive grid voltage,
so that the plates show color (for gettering action).

What range of plate voltage/ grid voltage do you recommend,
and what current limiting resistor would you suggest
in the plate circuit?
Do you use a current limiting resistor in the grid circuit also?
I plan a test fixture to recussitate
the 3-500Z tubes before risking them in an amplifier.

Thank you to the individuals who have added to my list but, as
the following document shows, there were at least 130 companies
'grinding away' back in 1943. It would seem that anyone who had a
garage and a drill press could get into the game.

Source record: 13129

A 200-Hz crystal filter for the Collins S-line went up to 300$ (see http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&ssPageName=ADME:B:WNA:US:112&item=5874468544&id=&sasel=)

300$ is just the price that Rockwell today quotes for reproducing any Collins S-line mechanical filter (though I am not sure whether that price also applies to the crystal filter).

The e-bay madness is partly caused by people not having yet appreciated that bidding days before bid end does nothing else that raising price. Why? Simple, because it is very common to run into one of those guys that want to appear as the high bidder at all times. You bid, and he will place incremental bids until he gets above you. You bid again and he will again bid until he gets the high bidder. An endless loop.

If everyone would only put an offer by the last half minute, prices would get lower, on average.

>Tony I0JX

Well you haven't looked very hard because it is there at the address I gave, being shown as the BC-224-F, K, BC-348-H, K, L & R maintenance manual. The only difference I can see between the 'R' and the rest of the versions is the front-end. It is large at 10MB or I would have emailed it you.

Cheers - Joe G3LLV

1334. FS: Icom IC-761 HF transceiver.....

From: Mike <mlinger@tamu.edu>
Message-ID: <dv493oopl1@news.tamu.edu>
Source record: 13135

FS: Once again I have my Icom IC-761 HF transceiver for sale. The previous buyer dropped off the end of the earth. It was sold but not a word from the buyer since then. The radio is extremely nice, works great, I've owned it a long time (6 years) and never had any problem with it. Includes owner manual, service manual, power cord and mike. I'll send pix to serous buyers. $585.00 Mike, (979) 696-4400.

Nice Hammarlund case fits the following vintage Hammarlunds:

HQ-129X, HQ-140X, HQ-140XA, HQ-150X.

No dents dings or extra holes that I am aware of) painted a blue
color, matches grey front panels nicely.

$75+shipping.

Matching Hammarlund Cabinet/Speaker 8in PM speaker works well and
delivers the rich sound as expected of speakers of this era.

No logo on cabinet :-(

$50+Shipping.

Please request scans of each.

Source record: 13136

FS: Collins KWM-2 transceiver in excellent condition. Had it sold but buyer didn't follow through. It has been in use on 75 meters (within the last week) with 130 watts out, excellent signal reports and it has been tuned up on the other bands all the way up to 10 meters where it puts out 110+ watts into a Bird wattmeter and dummyload. Front panel is 9.5+ (knobs too). No mods done to chassis. Don't have a power supply but will throw in a Heath HP-23 supply the would run it if you put the correct plug on it. The Heat supply is as-is, unchecked. KWM-2 cabinet has some minor scratches but overall looks very good. Manual included. u-ship, I box. $610. Mike, 979-696-4400.

> Do you use a current limiting resistor in the grid circuit also?

Ed,

I use lots of airflow and a variable voltage grid supply. Since the grid voltage is dc, you can use a simple Ig times Vg (to cathode) to calculate dissipation. In a operating amplifier you would have to use a Fourier (harmonic) analysis to calculate grid dissipation, but not at dc.

Set the grid just below rated dissipation. When Eimac initially gettered the tubes, they heated the grids well into color. I'm not that bold, although they told me they could get almost white hot without problems! So I stay at or below rated dissipation.

I use about 500-1000 volts of anode voltage, whatever it takes to show good anode color. I use an old AL80B transformer for grid bias and HV, except I don't voltage double the HV winding. A variac would be better, I switch taps.

I haven't tried it everywhere, but the tuner on the 2000 would never work on the 60 meter frequencies even into a dummy load and the factory knows of this. Most of these internal tuners have real limitations because of size restrictions. I have used an older LDG kit tuner in the mobile and found it superior to any of the internal tuners on various rigs. All tuners will have impossible or rediculous (undefined) matching situations though, requiring some kind of adjustment in the antenna system for any kind of efficiency.

1349. HX-50 Linearizing the output of the 2nd mixer & Driver stages - Help Please.

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-03-14 03:36:18 UTC
From: Paul P <paulREMOVE@REMOVEppinyotREMOVE.com>
Message-ID: <SSqRf.4312$Ub.2077@trndny07>
Source record: 13149

I found the 10m oscillator problem. The first plate choke needed more uh. I added an additional slug and the heterodyne oscillator sprung to life. I will later replace both slugs with a single one.

BUT

Now I am trying to linearize the output with in each band. While feeding in an external VFO frequency, with the heterodyne oscillator tube remove, one must sweep the band and insure it is with in 1db. I got all the bands except the 10m band. It is real tricky.

I use both a scope and a VTVM with RF probe. I can see the VTVM drop while the amplitude of the wave form stays relatively unchanged. But the wave form changes shape. It goes ever so slightly triangular and the VTVM drops like a rock. I can see why the original owner put an external filter on the case. It must have been throwing out harmonics.

I also found that it does not like 1k ohm carbon film resistors in the plate 300v B+ circuits (not the final). I replaced those with metal oxide.

Anyone ever successfully accomplish this alignment step? And how did you do it?

Please help before I pull out the rest of my hair.

Thanks,
Paul.

Hi Carter,

As other posters have mentioned, a lot of the 22'ers went thru various homebrew conversion schemes to FM. Many were done rather professionally so it might be hard to tell if yours is factory original.

Clegg had quite a few models after the 22 series.

If my memory is right, Squire-Sanders bought Clegg but then the whole operation was sold to some outfit called "ISG (International Signal Group?) and the Squires-Sanders name was discontinued.
I think Ed Clegg regained control of the ham product line from ISG and then later came out with the FM-27B, the first "all channel" FM transceiver.

The FM-27B wasn't really synthesized but used a crystal mixing scheme. It was known for its terrible intermod performance and spur generation both on transmit and receive. I owned an FM-27B. The local joke about them was that you could key up about 6 repeaters at the same time.

Clegg later broughtout his very fine FM-DX 2 meter FM rig but they were high priced arorund $650 for a synthesized single band rig. I don't think many were sold but a friend of mine bought one.

Clegg ended its company days by selling repackaged and relabeled Midland VHF rigs such as the FM-28 and acting as a dealer for other equipment.

I'm not sure but I think I read Ed Clegg's obituary in QST about 10 years ago.

73,

Doug/WA1TUT

>

Just turned 59. First licensed in 1963. Novice about 8 months then
took the general. First rig was a DX-60 and SX-101A. I had built a
Knight R-55 but never got it working well enough for ham radio use.
It was a sort-a OK, AM SWL radio.

Gotta say that 75 watts CW, crystal controlled on 15 meters (this is
in Hawaii) was the most fun of all. Used to work VK's, ZL's, and
JA's in the afternoon.

Kinda dropped out of ham radio over the years, what with computers,
programming in assembler and PL/I.

Now restoring a Signal/One CX7A as well as other boatanchors. I
have a theory that these things are way under valued as collectables
and relics of a never to be seen again, technological era.

I know folk who collect civil war stuff. While that is
"interesting", most of that can be made with blacksmith technology,
because, that's how it was made.

No one will ever make a Collins 75S-1 again. Ever. The technolgy
doesn't exist any more.

I've bought a couple items from list members, Collins. Good folks
to deal with.

For a number of reasons, health, miserable employers, some poor life
choices on my part, I don't have a lot of spare cash but what I
have, I've been investing in boatanchors.

The weird thing about the 75S-1 is that it looks modern, sorta. You
can tell that it's not a SX-28 or 75A-1 or NC-188. If I had the
cash, I'd buy every 75S-1 I could. It's right at that cusp where
they still used vacuum tubes but wanted to build smallish radios.

Adopted a SX-100 from a fellow who threatened to send it to the landfill. If he had only known to put a red dropcloth behind it, he could-a sold it for $1,600.

I just built the transmitter half of a PIXIE2 and plan to use it with an SB-303. Maybe get a WA6OTP PTO kit and use it with the SB-303. What fun that would be.

I built the PIXIE2 transmitter into a mini-DX-60. I submitted the pictures to eham but they haven't put them up yet. You can preview this at www.kiyoinc.com/dx60.htm

Let me know what you think. It's just a fun project.

I think of the SB-303 as another landmark piece of technology history. Solid state but not digital. 100% analog circuitry pushed to the limit to get the stability and frequency readout.

In the full range of history, there's an incredibly brief period when those things made sense. After about 1970, 1975, it's digital. Before 1955, 1960, maybe, the look was completely different.

I had a page up on Heathstuff but took it down for re-hosting.

I've been looking at the DVFO project sites and wonder why no one has set up one of those as a "all-bander" for S-Lines. Program the readout for the Collins 1st IF offset and 200 kHz steps.

Similarly, the Ten-Tec 1284, can it be that hard to program the PIC for 100/1,000 Hz steps? Anyone have a PIC de-compiler?

What a nice little receiver it would make.

Yes, my 35 year old Yaesu 570 with nothing but tubes is most certainly
classic but indeed it is not a BoatAnchor by our unwritten definition.

At least for now.

But as the elmers pass on and the next generation of tube heads come up,
they will make up their own definitions.

Just human nature.

Doug,

Thanks for the interesting info!

Some of the things I thought were mods (and that I unfortunately did not get in the picture) led me to believe they were mods until I looked more closely. For example, there were 2 female RCA jacks on the side of the radio, one on the bottom half of the case and one on the top half, connected by a 1 " long RCA jumper, for the speaker in the top half of the case. When I looked closely, I could see that the holes and slots in the case halves were die punched, not drilled or filed, and that the edges of the holes and slots were painted, indicating to me it was done in the factory (but as you point out, could have been done by a real "pro" at home).

I did a search and found an Ed Clegg, about 80 years old and with a W2 Tech call living in Florida and was going to drop him a note. However, if you saw the obit, I'll save the stamp! :-)

BTW, thanks to all who responded! As I just came across this incidentally in my travels and am not a Clegg collector, it looks like I may have to give the e-place a try to see if I can find it a new home.

Thanks again to one and all!

73,

Carter K8VT

Panduit makes a white fine tip marker for writing on black
nylon ties. It works great for things like this.

From the mists of history and country legend:
ORIGINS OF BOATANCHOR

THREE VERSIONS -- Opinions From The Internet.

Version I -- During World War II, Military Radio Techs used the term BoatAnchor as they struggled with the huge, heavy, electronic equipments of the day -- full of transformers, tubes etc. Also the US Navy frequently marked electronic gear with an anchor. After the war -- tons of the equipment appeared on the surplus market and was dubbed BoatAnchors due to the reasons above - one or both.

Version II -- After WWII a national magazine editor answered a query "As what to do with an outdated heavy, large, surplus electronic instrument?" and answered "Tie a line to it and use it as a BoatAnchor"

Version III To all those who expressed interest in the CQ magazine reference to boatanchors, I found it after only an hour or two of skimming. And I also found that some of my recollections were a bit hazy after all those years. The original letter to the editor (not to the "Surplus Editor" as I incorrectly recalled) appeared on page 16 of the October 1956 issue of CQ and was as follows: Gentlemen: I recently acquired a "Signal Corps Wireless Set. No. 19 MK II Transceiver." Are there schematics or conversion data for this rig? Any info will be appreciated. David J. Wilke W3LSG Pottstown, Pennsylvania The editor replied: The only conversion we seem to have on the files here at CQ calls for 100 feet of 1" Manila line, one end of which is to be tied securely around the MK II Transceiver.

This then converts the unit into a fine anchor for a small boat. If any readers have better conversions we will be glad to hear about them. Ed. This letter apparently generated a lot of interest and in the February 1957 issue of CQ there was a follow-up from CQ's editor, another letter from W3LSG and several pictures. If I find the time I will scan them and post links to them here.

The expression "boatanchor" may have originated earlier than 1956, as Doug Hensley pointed out. I found no earlier references in amateur radio than these CQ's, but there may be some. However, there was no reason to call amateur gear of that era "boatanchors" since almost all of it fit that description. It wasn't till later when smaller, lighter gear became popular that there was reason to categorize some gear as boatanchors. And it is also interesting to me that a word originally used to denote something of little value, useful only to anchor a small boat, has taken on a more affectionate meaning. We love our "boatanchors". Roger K6XQ

Roger,
Thanks for posting this. I almost fell off of the couch I was
laughing so hard!

Personally, I think the definition of boatanchor will change
with time. These days, I consider anything that uses tubes
(but not CRT's) as boatanchors, including my Kenwood
rigs that use tube drivers and finals. 30 years from now,
any pre-Pentium PC will be considered a boatanchor, and
highly collectable.

It's a tube rig made in America by Americans. I love my 78 Toyota pickup, but it will never be the classic a pre-70's American made vehicle is, it is worthless to anyone but me. Same for rice box radios, after the new is worn off, they're worthless compared to vintage American made rigs, just look on EBay. Yes, I owned rice boxes the first time around, thousands of dollars worth of rice boxes, and now they're worth the same amount as my 78 Toy pickup.
I'm really not trying to be nasty, just realistic.

When I worked for the DOD, the office supply, aka "Country Store", had
markers that actually contained some kind of paint. They worked very
well for marking equipment permanently.

I used a "Painters" fine tip made by Hunt Corp to letter an SP600 panel. It
uses
paint, works quite well if you have indented letters/figures in the panel,
but you
still might have to wipe off excess.
Got it in a Home Hardware type store, but it may be in art stores as well.

No, not at all. I have used German boatanchors and Soviet boatanchors.
Never used any of the prewar or wartime Japanese boatanchors, but I have
seen a few on display now and then.

If the input power in watts is less than the weight in pounds, it's a
boatanchor.

Well, than that leaves out the R-390/390A series. They weigh about 70-80 pounds,
and draw 140W w/o ovens, and 250W w/ovens.

It also leaves out the KWM-2, TCS, and just about everything else I can
think of.

Care to try again with your definition?

-Chuck

1375. Re: How old are you?

Source record: 13175

I'm 56, and got my Novice in '64, General in '65, Advanced in '69, and Extra in'78 (or somewhere around there). I was interested in electronics since I was about 10, maybe before that. Like others have said, I used to pick up old TV's and radios that were being thrown out, either to strip out the parts or to fix up and use.

I don't have a whole lot of boatanchors, but I do have the Heath SB-301/401 line that I use for my main operating equipment, and I also have a DX-40, HG-10 VFO, and an NC-300 that I recently fixed up and aligned. Also a Swan 250 that I use on six meters once in a while.

When I get tired of a piece of equipment, I buy a better one to replace it, then usually sell the old one since I have a limited amount of space in the shack.

Al, WA2AS

1376. FS As New Mosley CL-33-M Beam

Source record: 13176

I have a like new condition Mosley Classic 33 HF Beam for sale. It the late model CL-33-M and currently sells for $650 from Mosley. It has great gain on 20, 15, and 10 meters. It has a 18 foot boom.This one
was up for a little over a year and looks brand new. It has been taken down and is partially disassembled. It would be very easy to put it back together again since all pieces are color coded. It also would fit into a
pickup truck for transportation. The price is $300 picked up. I don't want to ship it. Or I can meet someone within 100 miles of Abilene, Texas.
Thanks, Charlie Hugg, K5MBX

Message-ID: <441876da$0$58084$742ec2ed@news.sonic.net>
Source record: 13177

Ed,
I suppose we'll have to agree to disagree.
I think the definition of 'boatanchor' is a fluid thing,
much like the definition of 'classic car'. My
1973 Datsun 240Z is considered by most to be
a classic car. So is my 1951 MG-TD, '58 Austin-Healey
100-6, and all of the other foreign made cars in
my collection. A teenager down the street from me
has a 'tricked-out' older Datsun truck. I'm sure he
considers it a classic.

The Kenwood TS-520, and Yaesu FT-101 rigs date
back to the late 1970's. If you compare one of these rigs
on the air to the newer fancy rigs, chances are you won't
be able to tell the difference. These are indeed classic rigs
that were very well built, and were relatively inexpensive.
Quite a few remain on the air today.

Not sure what you have against 'riceboxes', but I like
mine and will continue to use it, and enjoy it every bit
as much as my Halli HT-44/R-390 and Heathkit HW-101.

I have a CDE Ham IV Rotator for sale. It is the older model with the black
and white metal Control Box, not the Black Plastic one.
The Rotator needs cleaning and lubed and a new control cable screw
plate installed. Otherwise it works and looks good. Price is $185.
Thanks, Charlie Hugg, K5MBX

I have an Hallicrafters HT-32 that the power switch died sometime in the past,it removed and replaced with a toggle switch on the cast front panel, ouch!" I've acquired a new cast panel (3.5 pounds just for it, no wonder this is a real boat anchor).

Now I need the operation/power switch (Hallicrafters part number 060-200821) or just the on-off portion of the switch. If some one is parting one out or has just the SSB generator module
I'd be interested.

I like the term "classic". It certainly describes the equipment more accurately and adds a touch of dignity... unlike the term B/A!! Hi!!

My first connection with the term-in-question would have been in 1959. Having just traded a WRL DSB-100 double-sideband rig even for a BC-610E/BC-614/JB-70 from an AF Sgt, just returning from Guam, my local (sage)ham radio dealer informed me that "Nobody uses those old boatanchors, anymore!" Sounds like he picked up on that CQ mag article, maybe?

Source record: 13188

Is there a user's group for HP Test equipment (similar to the Tektronix Yahoo user's group)?

I recently purchased an HP 8640B Option 323 MIL spec signal generator and would like to swap information regarding this boat anchor (it weighs about 60 pounds!)

Regards,

Bernie, VE3FWF, Ottawa, Canada

Why is the dissipation rating of the 4-400A lower when used in grounded grid service than it is when used in the traditional configuration?

Source record: 12994

From URL:
http://en.wikipedia.org/wiki/Wiki

A wiki (IPA: ['wi?.ki?] <wee-kee> or ['w?.ki?] <wick-ey> or Wik-EE[1]) is a type of website that allows users to add and edit content easily and is especially suited for collaborative writing.

The name is based on the Hawaiian term wiki, meaning "quick", "fast", or "to hasten" (Hawaiian dictionary). Sometimes the reduplication wikiwiki (or Wikiwiki) is used instead of wiki (Hawaiian dictionary).

The term Wiki also sometimes refers to the collaborative software itself (wiki engine) that facilitates the operation of such a website (see wiki software).

Beats me, but their definition sounded good! I actually like Jerry's
better, but the older I get that means that BA's get smaller.

Source record: 13011

I have a brand new in the box Spi-Ro Trap Dipole Antenna, Model D-56
Professional Series. It sells new
for $152.95. Type Spi-Po Antenna into Google and it will take you to their
Webpage.
This antenna has 6 traps and is 82 feet long. It handle up to 600 watts. It
covers 10, 15, 20, 40, and 80 meters. I have the original instructions. It
has never been out of the box or plastic shipping bag.
Price is $92.95 and I will pay shipping in the lower 48. Thanks,
Charlie Hugg, K5MBX

Source record: 13012

Interesting that there are really two threads going here

1. What is origin of the name "Boatanchor"

2; What qualifies as a "Boatanchor"

For number one, a lot of research went into finding the origin
See results here URL:
http://ac6v.com/73.htm#ba

For number two. Qualifications -- lotsa opinions here -- many subjective
depending on the muscles of the beholder (;-)

Some proposed "Classic" -- I really feel the TS-520, TS-830, HRO models, and
several Collins do or will qualify as classic by virtue of obtaining a
standard of excellence, but a classic is not necessarily a boatanchor IMHO

But if you want to see a lot of real boatanchors see URL:
http://members.cox.net/wa6mhz/

Date: 2006-03-18 02:51:52 UTC
From: Edward Greeley <etgreeley@earthlink.net>
Message-ID: <cBKSf.5752$sL2.400@newsread2.news.atl.earthlink.net>
Source record: 13014

I am desperately seeking a filament selector switch, S107, for my TV-7D.
Actually, I only need section (wafer) E of the switch. Section E is the
one closest to the "top" if the instrument is lying face down on the
bench. If the instrument is face up as it would normally be in its case,
section E would be the one on the bottom, closest to the bottom of the case.

Does anyone have a junker to cannibalize? Will pay a reasonable price,
of course.

TIA for any help,
Ed Greeley

I have not had an 11 meter antenna up in the air since around 1972 or so. I have a clear memory of all the heterodynes and yacking on every channel that used to go on. I plugged one in again around 1985 or so, because a buddy of mine had one in his boat, and used it keep it on channel 5. Not much difference.
Anyway, last weekend...for yucks, I hooked one up to a longwire. I did not hear a single person on any channel! Perhaps it is the cross polarized wire antenna.
So, I shot a wire over a branch, and hoisted a CB vertical antenna ..Astron or Antron...something like that...a pretty good fiberglass antenna!
Still, other than a general high noise level...no signals!
Channel 19 used to be jammed...even with a handheld whip antenna!

Is CB no longer??

Perhaps it might be useful again!!!

Anyone check the band out lately?

....Dave

I, too, have listened to 11 meters on a couple of old tube radios and, while the frequencies aren't as crowded as they once were, there is activity--more so on weekdays than on weekends. Also, with sunspots the way they are, any activity is usually likely to be local. If you listen to 10 meters you'll also find precious little activity.

We are near the bottom of the 11 year solar cycle
thus very poor "skip" conditions on the upper bands
See URL:
http://www.dxlc.com/solar/solcycle.html
Or

http://www.arrl.org/qst/propcharts/2006/04/mid.pdf

One might hear some local line of sight signals but not like the "old" days
--
CL -- I doubt, therefore I might be !

>>I get the best traffic reports available by listening to the truckers.<<

I'm a retired driver (Sears) and spent a lot of time driving at night in the Ozark country of N.E. Okla, S.W. Mo and N.W. Ark back in the 60's and 70's. In those days they still had open range, winding narrow roads that trucks mirror brackets wouldn't each other by 6 in.. The big danger were "cows in the road" or "truck jack knifed" just around that next curve. I'm convinced I would have never survived that job with out the warnings I got over the CB radio. RM~

PS, All truckers get a bad rap because of a very small minority who act like idiots on the radio. Most are like you, they don't or rarely xmit.

1427. Kenwood R600 available?

Anyone know where there is a nice Kenwood R600 available for sale? I don't see any on eBay right at the moment and would possibly prefer to buy one outright.

Thanks,

Barry - N4BUQ

The Citizens Band (CB) is one of several Personal Radio Services, regulated
by the FCC.
http://wireless.fcc.gov/services/index.htm?job=service_home&id=personal_radio

Outside of usage by trucking industry on the highway, "CB" as known by the
general public during the craze of the 1970s - is as dead as 8-track tapes
(still seen on TV series That 70s Show). Why?

Technology, Politics and Public has moved on ....the original needs
(requirements) that attracted the general public to CB have largely been met
by BETTER solutions for the general public.

1.) Reagan / Bush [41] Administrations, 1980s.
Low tolerance for foul language and unreliability of the communications that
the CB service became in late 1970s - especially with conservative family &
religious groups.
A number of new services were proposed and approved that targeted specific
requirements (e.g. groups that required personal communications
[short-range] without the "non-family" language and behaviors) -- this
became the Family Radio Service (FRS). GMRS and MURS added for small
businesses and organizations.
Most of these changes were completed around 1990.

REQUIREMENT: Quiet, safe communications for families - MET (FRS)
REQUIREMENT: Realizable safe short-distance communications for volunteer,
community and small business usage - MET (GMRS, MURS)

2.) Cellular Telephone development.
Motorola pioneered development of an "analog" (AMPS) cellular telephone system in late 1970s and early 1980s.
As the nationwide cellular network was built up over the next 15 years -- the ability to have a mobile or car telephone became affordable to anyone.
Today, there are more mobile (cellular) telephones than wired phones in the US.
In conjunction with the development of "911" centers throughout the US in the late 1980s and 1990s.

REQUIREMENT: Emergency communications when traveling. MET
Cellular telephones provide a telephone that can call anywhere in the world.
911 service centers provides instant communications to local public-service agencies.

3.) Global Positioning Systems (GPS).
Originally developed for the military by defense contractors (Rockwell-Collins was one) in the late 1970s and 1980s.
Civilian usage of GPS was expanded in the 1990s. With President Clinton's executive order in 1990s - the accuracy of the GPS system (only available to the military) became available to the general public - worldwide. GPS systems coupled with a map database is a common automobile option or feature and readily available as a handheld device (e.g hikers, campers).

REQUIREMENT: Need for directions, when lost or in an unknown area. MET (GPS)
In addition GM's OnStar system (as advertised on radio & TV) - combines # 2 and # 3 -- 24 hours a day/ 7 days a week.

4.) National WX Service Broadcast Service - Weather Radio
The small National WX broadcast system of the early 1980s was expanded to cover the entire US. Additional system enhancements included digital alerts and encoding - for textual information - in addition to the audio broadcast.
Handheld and home receivers readily available. Not yet see as option in US automobiles.

REQUIREMENT: Notification of severe weather events MET (Expanded NWS)

5.) Internet - expansion and widespread usage.
Another military and research network, it was expended and made accessible to the public in 1990s. Internet explosion occurs when coupled with personal computers and with development of HTTP language (web pages) and browser technologies (Mosaic, Explorer, Firefox). "WiFi" is the mobile version. New solutions coming to market before end of 2008.

REQUIREMENT: Desire to public to congregate in small groups for incidental communications and information sharing (including gossip). PARTIALLY MET
Internet Access, Bandwidth and Coverage is still expanding worldwide.

That's a start. Of course there is always propagation (solar cycle) - which as you may have heard last week - we are better prepared to predict thanks to observations satellites in solar orbit and computer models (originally developed for military/Cold War and weather forecasting are applied solar observation data.

Hi

The Kurrajong Radio Museum near Sydney, Australia is getting close to opening after several years of very hard work by the owner, Ian O'Toole, VK2ZIO. To give you a taste of the several hundred, mainly military, radios from all over the world and other display items, over 60 pictures have just been uploaded which can be accessed from the museum's web site at http://www.vk2bv.org/museum/ The web site also contains detailed descriptions and photos of over 80 different military radios, in many cases with schematics.

1439. FS Nice HP 410C VTVM

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-03-19 17:52:26 UTC
From: Charlie Hugg <hug-a-bug1@cox.net>
Message-ID: <kTgTf.270361$oG.208030@dukeread02>
Source record: 13039

The 410C replaced the 410B and was eventually the last VTVM ever
produced by hp. This one comes with the optional AC probe. The probe has a
vacuum diode inside it's body - it will warm-up you hand. The amplifier is
feedback stabilized, so the pointer shows absolutely no swing when applying
a signal. The Model 410C is an extremely versatile general-purpose
instrument for use
anywhere electrical measurements are made. The Specs are below:
AC Response 20Hz to 700MHz
Output 1V f.s.
Power 13 watts
Dimensions 6-1/2" x 5-1/8" x 11"
Weight 8 lbs (4 kg)
Technology tube, transistor
Price (for 1968) $ 425 w/ AC probe
My price for this one is $125. It is in great shape. I can send digital
pictures. Thanks, Charlie Hugg, K5MBX

1440. Jerrold Texscan 9300A ?

I just picked this cable TV test set which is a Sweep Spectrum Analyzer and
I think it and the RF sweep gen go up to 300 MHz. It still kind of works
but has several capacitors disconnected on some of the boards. I've
Googled, Dogpiled and Vivisimoed and can't find any info. I'd like to find
a manual/schematic, specs, ops manual or whatever and hope someone out there
has a copy I can buy.
tnx

Source record: 13045

FS: Drake TR-4Cw/rit + AC-4 + MS-4 combo

The TR-4CW/rit was one of the last off the line, serial no. 45311, and has the hard-to-find 34-PNB noise blanker installed, which I've seen go separately for $200. It is extremely clean, a conservative 9+. Flawless front panel except for one 1/8" scratch below the RIT button. Cabinet top is perfect. Both sides are perfect except for one very small scratch on the left side. Chassis is clean, no corrosion, no smoke deposits. No evidence of modification. Two extra crystals are installed for full 10M coverage.

The AC-4 power supply is installed inside the MS-4 speaker cabinet. The MS-4 has a few superficial scratches on top. The front grille is perfect.
Interconnect cables and repro manual included.

Make serious offer
Ready to sell.

1448. FA: Lots of old and new parts for BA gear

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-03-20 02:05:48 UTC
From: "Jim, KK1W" <kk1w@charter.net>
Message-ID: <16oTf.162$ny5.20@fe07.lga>
Source record: 13048
Cross-posted to: rec.radio.amateur.boatanchors,rec.radio.amateur.homebrew,rec.radio.swap

Hi,

Take a look at these auctions: http://search.ebay.com/_W0QQsassZkk1w2000.

Lots of old and new parts, caps, resistors, pots, coils, meters, crystals
and more. Low starting bids and good feedback rating.

Jim, KK1W

1449. Amphenol 621-685 coax?

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-03-20 02:40:39 UTC
From: bg998@FreeNet.Carleton.CA
Message-ID: <dvl4n7$a0d$1@theodyn.ncf.ca>
Source record: 13049

Does anyone recall the basic specs for "Amphenol No. 621-685" coax cable?

There are no other markings on the cable than that. It looks like RG-59 in size. Apparently Amphenol no longer make it and a Google search turned up nothing.

Thanks for any info.

... Martin VE3OAT

As time marches on, that boatanchor definition will inevitably expand
to include tube radios of all sorts.

And why shouldn't it? Those early "rice boxes" have a lot in common
with the "true boat anchors".

They are all vintage radios, and of a design not made any more.

Don't sweat it - it's all good...

Since we are dealing in exact definitions here - its that thingy on a
boat that is supposed to keep it in one place. Kind of a hooked cross on
a big chain.

When did old time radios become "boatanchors"? hehe ;^)

1454. Hallicrafters S-20R alignment

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-03-20 05:03:07 UTC
From: Skyrider <mudshark@qnet.com>
Message-ID: <1142830987.080488.163490@g10g2000cwb.googlegroups.com>
Source record: 13054

I am having a problem aligning an S 20R. The receiver has just been re-capped, however the problem I have been having was present before the set was touched. (The set just has much better sensitivity and the transformer runs cooler now). The problem I have been having is this: When I try to align on band 3 (the only band which gives problems) the closest I can bring it to proper alignment puts 7 Mhz at around 7.5 or so on the dial, and 10 MHz at about 12 Mhz on the dial. I cannot bring the dial tracking any closer than this. The other bands seem OK. I have checked the wiring against a parts receiver and do not see any problems. I verified that the oscillator is 455kHz above the received frequency by checking a known working S 20R (which I have owned for 36 years). There does not appear to be any problem with the trimmer/padder caps or the coil.

Any ideas???

Source record: 13058

This is where a grid diper is handy, since you are measuring the resonant frequency of the circuit, without anything else. Check the resonant frequency of the coils in both S-20R radios. At the calibrated frequency, they should be the same.

There could be a number of problems - especially if someone has fiddled with it. Are the coils the same? At 12 MHz, the frequency is off. I think you will find one of these possibilities:

1. There is a unwanted fixed capacitor in the circuit.
2. the adjustable capacitor does not go down tominimum capacitance.
3. The coil is not adjustable like it was intended.
4. Someone has added turns to the coil.
5. Someone has removed the correct slug and substituted another core of different material.

I would suspect 5 first if everything else looks normal.

Once in awhile, you will find something like that that probably slipped through from the factory - but not likely.

If you do not find the specs, you can simply measure the diameter of the inner conductor and the diameter of the shield. Then you can calculate the impedance using the ARRL Antenna Handbook.

Easy to do.

Are you sure it's a coax cable? Strip it and see if you don't get lots
of carbon black on your hands in the process. If so, it's a low-tribo noise
cable and not good for RF. Amphenol made a bunch of different kinds.

Amphenol has not made any cables for at least twenty years, though, so
this is not recent production.

I'm not familiar with that receiver, but I have a general suggestion.

Be sure you are adjusting the trimmer cap and coil slug at the correct ends
of the dial. On any band, the designer might use either the sum or
difference frequencies out of the mixer, which may call for tweaking the
trimmer (hi freq end of the loc osc) to set the low freq end of the dial,
etc.

Don

Because it is an auction
Merriam and company defines it as
a sale of property to the highest bidder
In this case 7+ folks have bid -- 52 times !!!!

WHY

The highest bidder perceives value thus bids accordingly
Perhaps money is no object
Perhaps they are bit by the nostalgia bug and just got to have it
Perhaps they have a radio museum and this is a rare find for them
Perhaps they surmise that very few exist, thus it might be an investment for
future sale
Perhaps they are a collector of Heath kits and I suspect an unbuilt SB-104
is a pretty rare bird

One of the TV personalities has bought several ham radios off e-bay at very
high prices - he can afford them !
You and I can not thus we are amazed and puzzled (;-)

I have a parts chassis with intact gearbox and missing BFO transformer. Go figure -- the guy I got it from had stripped off all sorts of things and installed solid-state boards to make some kind of HF Franken-rig.

You can see a photo at:

http://antiqueradio.org/art/temp/SX42JunkerChassis.jpg

I'd be willing to take out the gearbox and pack it up for $10 plus shipping cost. (Hey, time is precious when you have this many backlogged projects :-)

To contact me via email kindly go to http://antiqueradio.org/contact.htm .

Colin and Don,

Thank you for your suggestions, however in my case I don't think they will apply...

Unfortunately, a grid dipper is one item I do not own, so I am flying blindly in that respect. To determine the oscillator frequency, I have been tuning an Icom IC745 455 kHz above the target frequency and listening for the S 20R's oscillator. As for your otber suggestions:
1. I have not been able to find any undocumented fixed caps in the circuit. (Unless one was hidden inside the coil.....)
2. I checked the padder with a capacitor checker and it seemed to adjust OK.
3. The coils on this receiver, unlike those on an S-40, are not adjustable.
4. The coil does not "appear" to have been molested
5. Since there are no slugs, and no place for slugs, that wouldn't be the case.

Since the other bands line up fine, I think the procedure I am following should be OK.

I can't imagine something like that having slipped through from the factory, but I suppose anything is possible...fortunatly I do have a junker set to get the coil from, I just wanted to see if there was anything I overlooked before removing the whole oscillator coil sub-assemblies (probably would swap the entire units rather than take them apart to replace one coil....)

Forgive me for questioning you, but something does not seem right. Have you checked the good S-20R to make sure that its oscillator is 455 kHz above the received frequency and not below?

I assume the trimmers are mica. You can roughly check the capacitance by how tight the plates are meshed. Are the capacitors in both radios about the same?

I still think you are aligned to the image and the method you are using is confusing you.

Try this. Take your good S-20R and set if for say 10 MHz (wwv is good). Then, listen to the oscillator. Assume that is 10.455 MHz. Now, take your bad S-20R and set the dial to 10 MHz. Then, set your Icom to 10.455 and adjust the capacitor until you hear the oscillator on your Icom. It should be working.

Get a cheap grid dip meter - they are quite handy, even though you have figured out a good workaround.

Colin K7FM

1479. WANTED: Museum seeks B-17G Flying Fortress radio/radar equipment

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-03-21 03:34:28 UTC
From: k5dh@qsl.net
Message-ID: <AridnZeHf8rZ6YLZRVn-iw@centurytel.net>
Source record: 13079
Cross-posted to: rec.radio.swap,rec.radio.amateur.boatanchors,rec.radio.amateur.equipment

WANTED: B-17G Flying Fortress radio equipment

This is a long message... please read it all!

The Vintage Flying Museum of Fort Worth, Texas, home
of B-17G N3701G, "Chuckie", is seeking DONATIONS of
any kind of radio and radar equipment that would have
been used aboard B-17G's built from early-1944 on.

Our airplane is a B-17G-70-VE, serial number 44-8543A.
She was built in January, 1944, by the Vega division
of Lockheed (B-17G's were built by Boeing, Douglas,
and Vega). She was converted to a "pathfinder" model,
which means she had a radar set installed in place of
the ball turret which allowed bombing through overcast.
Very few Forts were converted for this mission, and it
is possible that our Fort saw combat time over Europe.
The combat records of the pathfinder Forts are still
classified, so we may never know for sure.

Right now, the only original radio gear installed in
the airplane is a BC-348-P receiver and shock mount.
We need everything else. Some of the specific items
we seek are the BC-375-E transmitter, tuning units
TU-4B through TU-10B, BC-306 antenna matching unit,
the wooded tuning unit storage rack that mounts to the
rear bulkhead, ceramic feedthrough insulators, power
and control connectors, and cables. We're also looking
for command set transmitters, receivers, racks, cables,
control boxes, spline cables (the LONG ones that will
reach the flight deck ceiling), modulator, and so on.

Obviously, we are looking for NICE equipment that is
in display condition because we display the airplane
both in the Museum and at air shows and fly-ins. We'll
certainly accept donations of "parts units", but the
primary focus is on acquiring gear that looks good
enough to be installed in the airplane. We want to
impress our tour guests at the air shows with a great
looking radio room! Do you have some surplus military
WW2 airborne radios stashed in your garage or attic?
Would you like to see them go to a good home? Please
donate your equipment to VFM and help us restore the
radio compartment in our beloved B-17! Any radios and
accessories that we don't use in the airplane will be

either put on display in the Museum's exhibit hall or sold off to generate money to help finance the effort (no matter how much gets donated, we'll still end up having to buy some stuff to complete the job!).

We are a small museum, and we have very limited funds available to spend on things that don't actually help us to keep the airplane flying. We are looking for DONATIONS of equipment. We are a 501-c-3 tax-exempt charitable organization, and we will provide a tax receipt for your donation.

"Chuckie" is one of approximately 15 B-17s worldwide that are still in flyable condition, and one of about 10 that is flown regularly. Please don't "bash" me if my numbers are off by a plane or two; the numbers go up and down as some Forts come out of restoration and others go down for heavy maintenance or retirement. She participated in the fabuluous Thunder Over Michigan air show in 2005 in which EIGHT of the remaining B-17 population were not only present at the show, but flew together! It was the largest gathering of civilian B-17s in history, and it may never be repeated.

Please visit the Museum's web site:

http://www.vintageflyingmuseum.org

I have been authorized by the Museum to be the focal point for this effort. Please address your messages directly to me.

We're also looking for a complete chin turret if you happen to have one stashed in your barn! Actually, we will graciously accept donations of ANY B-17 parts that you might have lying around. :)

My final request is this: If you have nothing nice to say about this effort, please say nothing. If you are not a warbird fan, if you believe our effort is a waste of time and money, if you think we're "glorifying" war, if you think operating antique warplanes is dangerous and should be outlawed, etc, etc... you're entitled to your opinion, but I respectfully ask that you keep it to yourself.

Thanks and 73,
Dean Hemphill, K5DH
Vintage Flying Museum member

1480. Re: Hallicrafters S-20R alignment

Newsgroup: rec.radio.amateur.boatanchors

Just a thought about something simple you may have overlooked. Do the end index marks on the dial line up with the extreme travel limits of the variable cap? It might be off a little and the other bands might have been aligned to the error where as band 3 might have less adj in it. Mike KF6KXG

1481. Re: Hallicrafters S-20R alignment

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-03-21 05:26:59 UTC
From: Skyrider <mudshark@qnet.com>
Message-ID: <1142918819.148768.68860@e56g2000cwe.googlegroups.com>

"Forgive me for questioning you, but something does not seem right.
Have you
checked the good S-20R to make sure that its oscillator is 455 kHz
above the
received frequency and not below? "

"Try this. Take your good S-20R and set if for say 10 MHz (wwv is
good).
Then, listen to the oscillator. Assume that is 10.455 MHz. Now, take
your
bad S-20R and set the dial to 10 MHz. Then, set your Icom to 10.455
and
adjust the capacitor until you hear the oscillator on your Icom. It
should
be working."

Did that. I wanted to verify that the oscillator operated above the
received frequency on band 3. (It does, same as on bands 1 and 2. It
operates at 455 kHz below received frequency on band 4).

In fact, I can align to the image and get it to line up at 7 MHz. Of
course, when I do that, the mixer and RF stages no longer track very
well, and it would be really annoying to have to turn the receiver on
its side and readjust those trimmers as you travel down the band. If I
align the correct way, the mixer and RF stages track (sorta)...better
than if I align on the image, but still not quite right (would make
sense if the oscillator is not tracking right....mixer and RF are
probably tracking fine....just not keeping in step with the
oscillator).

BTW...no need for forgiveness....without questioning it'd be danged
hard to figure out what's going on here....which is why I'm here to
begin with.

1482. Re: Hallicrafters S-20R alignment

Newsgroup: rec.radio.amateur.boatanchors

Message-ID: <1142919267.572197.102910@e56g2000cwe.googlegroups.com>
Source record: 13082

Since I have had the receiver in and out of the cabinet numerous times,
and since I have to turn the receiver chassis upside down I have to
remove the dials to keep from damaging them, I have had many
opportunities to make sure that the index marks line up correctly.

But thank you, it is a good thought....

1483. Re: Hallicrafters S-20R alignment

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-03-21 06:29:52 UTC
From: Edward Greeley <etgreeley@earthlink.net>
Message-ID: <441F9D43.5050800@earthlink.net>
Source record: 13083

Er...it's late, and maybe my thinking is a bit muddled, but: it sounds to me like you need to get the oscillator freq LOWER than it is now going. The earlier follow-on posts seem to be discussing ways to get the oscillator freq HIGHER - unwanted extra capacitors, inability to loosen the trimmer sufficiently, wrong slugs (which you don't have), etc. In my muddled little mind, it seems you need MORE capacity and/or coil inductance to get the oscillator freq LOWER, i.e. the oscillator needs to be at 7.0 MHz + 455 KHz = 7.455 MHz rather than 7.5 MHz + 455 KHz = 7.955 MHz as you now have it. So, is there a chance that there is supposed to be a little fixed ceramic or mica capacitor in parallel with the adjustable trimmer cap across the oscillator coil that is open, broken, or missing? Again, you need to get the oscillator freq LOWER, not higher, don't you? Okay, so broken is the same as open; I said it's late!

Good luck!
Ed Greeley

Up to this point I agree with everything you have to say.

But I'll say what I please about your efforts, and defend to the death
the right of others to say it, as well.

You don't have to like it, and you don't have to read it, either, but
everyone else is as entitled to state his, her, or its opinions on old
warbirds as you are.

That said, I hope you're successful in your quest.

I'm appalled to see your group is flying this priceless airplane.
Sooner or later someone will crack it up and there will be one less for
future generations to see. Please put pressure on your group to ground
it permanently and preserve it forever so out great-great grandchildren
and all future generations can have the opportunity to see the real
thing and not some replica.

Hello all !

The Drake Forum will be one of the Forums at The Dayton Hamvention 2006.

I'm going be one of the speakers with a new picture-presentation of Drake
stuff.

And a lucky person will be the winner of a DRAKE TR5 transceiver in
excellent
mint condition!

Take a look at http://home.online.no/~sindtorp/tr5raffle.htm for more
details about the raffle and the program for the forum.

See you at The Dayton Hamvention 2006.

Sindre Torp, LA6OP

Unreal..... Lemme guess, you collect boatanchors, restore them, then refuse
to power them up?
Someone once told me ham radio is a 'condition', not a hobby. I'm starting
to think he was right.

Best of luck from Oshkosh ! "Aluminum Overcast" made it's first flight March 7th since it's gear collapse about a year and a half ago. As long as it was necessary to repair the nose, props and fit new gear it underwent an entire overhaul and received four brand new engines as well ! It's amazing what can be found for these old workhorses if you look hard..... it starts it's yearly tour at San Diego's Gillespie Field Airport on March 31st.

Although they are fast fading away, the look in the eyes of the men who crewed these that visit while it's on tour are worth all the effort. I've seen 80 year old men walk over and kiss her nose and quietly shed a tear.

So; if they don't fly it, don't keep it airworthy, what if a hurricane comes along, does it just sit and wait to be ripped to shreds? More power to them, if they fix it they should fly it. I know of a collector of fine rare cars, he isn't afraid to send them off to vintage races or put them on the road. I am also amazed how collectors rebuild from almost zero remains, so even if it gets busted up...

1495. New Program. Transmission Line Transformers

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-03-22 00:44:03 UTC
From: Reg Edwards <g4fgq.regp@ZZZbtinternet.com>
Message-ID: <dvq6ki$q9$1@nwrdmz02.dmz.ncs.ea.ibs-infra.bt.com>
Source record: 12945

There are two transmission lines in cascade plus a load impedance.

The first line can be considered to be the main line from the
transmitter.

The second line can be considered to be an impedance matching
transformer between the first line and the antenna.

What is the impedance and length of line in the transformer if the
antenna feedpoint impedance is not purely resistive?

What are the input impedances of the two lines, R+jX ?

What percentage of transmitter power is dissipated in the two lines?
What is the overall power efficiency?

The answers can be found in new program TWOLINES.

SWR is not involved.

Download program TWOLINES from website below in a few seconds and run
immediately.

The only thing you have to have "original" on an aircraft is the data plate. Everything else can be salvage, new parts, homebuilt parts, whatever. The data plate is the key.

I have a like new condition Mosley Classic 33 HF Beam for sale. It the late model CL-33-M and currently sells for $650 from Mosley. It has great gain on 20, 15, and 10 meters. It has a 18 foot boom.This one
was up for a little over a year and looks brand new. It has been taken down and is partially disassembled. It would be very easy to put it back together again since all pieces are color coded. It also would fit into a
pickup truck for transportation. The price is $300 picked up. I don't want to ship it. Or I can meet someone within 100 miles of Abilene, Texas.
Thanks, Charlie Hugg, K5MBX

By Radioworks, none the less.

Radioworks auctioned a Drake R4C that belonged to a friend of mine as "one of the finest Drake R4C's ever from my personal collection".

They bought it just a week or so before selling it, so it wasn't in his collection long.

Thanks to Scott and Colin for your suggestions. It is indeed coax cable
as I cut off one connector, somewhat crimping the inards in the process.
It sure does look like RG-59 with solid dielectric and solid copper
center conductor, although I don't have any of that to compare directly.
Will have to unsquash it and make some accurate measurements.

Thanks again, fellas.

An airplane that is not flown is so much scrap metal. They were designed
and built to be flown and in the air is where they belong. If someone wants
a static display let them build a replica.

Add to that the fact that this 'priceless airplane' is only such
because this group invested heavily in its existence. Without their
contribution of time, effort, money and hardship, it would--in
fact--(still) be only so much scrap metal.

Source record: 12957

Hi Gang:

I found this in the basement and don't need it because I don't have this piece of equipment. I can't even recall how I came to have it. If you have one of these freq meters (with the cool film strip readout) missing the cover here's your chance to pick it up. It is in very clean condition; paintwork is excellent with a couple of die-size abrasions on the front. Rubber sealing gasket is excellent. The AC line cord is also there but the plug is missing. I'm asking $15.00 plus postage for it; any takers? Please reply by e-mail.

Tnx es 73,

Michael, W1RC

> For crying out loud Mike, was that TRULY necessary?

I think it was. Usenet is in many ways the equivalent of Speakers'
Corner in Hyde Park, London. omeone trying to foreclose comment on
his project, after he posts about it on Usenet, is in the position
of telling the folks around him at Speakers' Corner that they can
listen or not, aas they please, but they aren't to comment.

I've been doing this Usenet stuff, for work (mostly) and play since
1983 or so, well before hoi polloi had access to the big-I Internet,
and I want to keep its open flavor intact.

You have the right to have a different opinion, and (unlike k5dh), I
won't ask you to keep it to yourself.

Strip some. See if you get graphite on your hands. If you do, it's not
RF coax. If you don't, measure it.

No, Bill posted his little rebuttal because he thinks the OP is an idiot but hopes he will come to his senses anyway.

Throughout history there have been many irreplaceable treasures lost because nobody thought future generations would might like to see the original instead of a replica. A real, genuine B-17 is a priceless relic of an age that will never be repeated. Save it.

Well, I am sorry to hear that Bill. You obviously aren't familiar
with the major causes of loss in restorable antique aircraft:

(In approximate order)

1) lack of people willing to pay for restoration
2) hanger fires
3) natural disasters.

I have seen a few rare aircraft that have crashed, and guess what?
As soon as they get the pilot out, they go back into restoration.

There seems to be loads of money available to restore antique aircraft
to flight, but little available for restoration to static display.

And in my opinion, that is exactly how it should be. Whoever pays
the freight gets to decide how the plane is used. Everyone else
is just a spectator.

-Chuck

If you feel that way you should purchase them and put them in a museum.
Most would not have survived and will not survive without the intent to fly.
Not much money available for the restoration of static displays. Lotsa
money available for flying restorations. Glaicer girl is an excellent
example.

Heh, I'm as real as it gets, brother.
So you do collect boatanchors? Do you also have an attic full of empty radio boxes? I'm betting you do.
But that's your choice, now isn't it? And nothing wrong with it.

On the power-up thing,
I disagree, citing that it depends on how much power is applied to it.....
:-)
Or it could catch fire and burn to the desk... or the ground... or if it were donated to a B-17 restoration, it could very
well end up splattered all over a hillside somewhere... LOL.

And yes, *I* get it.... enjoy what you have or what's the sense in having it??
Moth-ball a vintage plane in Tucson, AZ or some museum, and I'll NEVER get to see it. Fly it to my local fly-in and I do...
[said while gazing up at the photo of my daughter sitting left-seat in the Texas Raiders 17g when it was HERE at a fly-in.]

Everything is disposable and it certainly doesn't transgress to the 'other side'.

Use it or lose it; 'cuz cars are for driving, radios are for driveling into, and an aircraft is for flying.

There's a fine line between being a
keep-the-box-because-it-matters-to-other-boxkeepers packrat, and preserving history.

Do *you* get it??

And the Memphis Belle is an example of a static display going down the tubes.
Still not finished and now moved to Dayton, the US Air Force museum due to
lack of funds to keep the Belle in condition. Those machines were meant to
fly and should be flown. It's really sad to see them rot away on the ground.
In the air they are living history, and give peole a chance to experience the
ground pounding thunder of their mighty engines as they soar overhead. And
very ocaisonally one may get the opportunity to fly in one of them if they
are very lucky as a friend of mine did a few years ago in one of the last
Lancaster bombers left flying.

Absolutely, I get it.

You and the two or three posters who agree with you are self-centered pigs who care nothing about preserving history. Your temporary adrenaline rush is much more important, and the risk of splattering a priceless aircraft means nothing beside your momentary thrills. How sad that people like you are allowed to own such an aircraft.

A hundred or five hundred years from now, if your ilk prevails, people will be saying "Gosh, I wish someone had kept a B-17G preserved somewhere. I would have really loved to see the real thing".

I hope and pray there are not many like you.

Bill is 100% correct. He should negotiate and buy the plane from the restorers for its priceless value, say $50-100 million, he can then store it and show it to whomever he pleases! That is the American way!

Bill is 100% correct. He should negotiate and buy the plane from the restorers for its priceless value, say $50-100 million, he can then store it and show it to whomever he pleases! That is the American way!

He won't buy it. All the weenies that complain about somebody else spending their own money to restore and use something will do nothing except huff and puff like the litlle piggies.

I plug in my boat anchors. I heat my shop with an FRR 59 . I would never think of just leaving it sitting there collecting dust and rusting away.

********** REPLY SEPARATOR **********

Absolutely, I get it.

You and the two or three posters who agree with you are self-centered pigs who care nothing about preserving history. Your temporary adrenaline rush is much more important, and the risk of splattering a priceless aircraft means nothing beside your momentary thrills. How sad that people like you are allowed to own such an aircraft.

A hundred or five hundred years from now, if your ilk prevails, people will be saying "Gosh, I wish someone had kept a B-17G preserved somewhere. I would have really loved to see the real thing".

I hope and pray there are not many like you.

Bill T.

Your boatanchor will not be destroyed by plugging it in and using it on your bench at home. No problem there.

On the other hand, if it is one of a very few remaining, it might not be a good idea to take it on a one-man kayak DXpedition across the Bering Sea in winter.

Airplanes crash, especially ones flown and maintained by well-meaning but inexperienced pilots and mechanics who are usually short of cash, spare parts and time, and who, sooner or later, will feel the pressure to fly it when they really shouldn't in order to keep an airshow schedule.

Park it.

Bill T.

1536. Parts for a Halli SX-43

Is anyone parting out or have a parts Hallicrafters SX-43 ??
I am starting on restoring one and, while looking at something else near the coil bank, I noticed soot on the bottom of the chassis. Close examination showed that the Band 1 [BC Band] antenna coil primary is fried -- data says it should be 26 ohms and it reads 8.8 ohms, so it is well shorted internally. Above the bandswitch there is also some soot and I found the primary of T5 the Band 5 antenna coil is also fried, but since it is only a couple of turns it looks fixable. Alternatively, does anyone have any data on those coils such as turns count so I can rewind T1 's primary. A good excuse to make a Pi winding attachment for my coil winder.
Thanks for any information anyone might have!

I've wondered if some American-made tube radios could really be
called boatanchors, such as the S-38. It's small, line-powered and
thus NO power transformer, and light enough that even if it doesn't
float, I wouldn't feel confident using it to anchor the smallest boat
that would hold me.

I recall my father's NC-300. He used it for a short while with his
SB-400, then when he got and assembled an SB-301, he put the NC-300 on
a separate table for SWL. That thing has double conversion, lots of
tubes including one for current regulation, a VR-150 for voltage
regulation, a 100kHz crystal calibrator w/oscillator tube, and of
course a power transformer to run them all that by itself must weigh
many times more than an S-38. It's got the mass of a boatanchor, and
so in a pinch (when you don't mind destroying a perfectly good radio)
it would work well to hold a boat in one place.

Just a thought here, but I'm sure that nobody at the Boeing factory back in the 1930's through early 40's (not EXACTLY sure of the years of production, but it's close enough) had even a HOPE that ANY B-17 would still be flying in the year 2006. As a matter of fact, during the darker days of 1942, I'm sure that most pilots of B-17's were positive that NO B-17's would be flying as late as 1943!

Face it. The aircraft was built to be a warbird. It was designed to fly, take damage, be repaired, and jump back into the air. Fly it until she dies. She deserves it. It's called a death with dignity.

A follow up....

Found the problem, and thank you for all your input.

The problem turned out to be none of the things anyone suggested, but Andrew came closest when he mentioned the band switch.

Here is the story:

Looking at the band switch, I noticed a wire on a grounded terminal which had a somewhat cruder solder joint than those on the other terminals. This wire was 1/2 of C-38, a coupling (listed in the manual as a neutralizing) capacitor consisting of a couple wires twisted together. This "capacitor" was supposed to couple from the band 3 oscillator coil to the mixer, instead the oscillator side was grounded. And what about the wire which had been attached to the oscillator? It was attached to the band 2 oscillator coil. Snipped out the ground wire, snipped the wire from the band 2 coil and re-wound it with the wire going to the mixer, and now all is well.

I had looked over the circuit before, but apparently I missed this "modification". Now I have to wonder....what was it that the person making this modification was trying to achieve?

Jeeze Loooo F***in' Weeze Folks! Stop the Global Whining! I don't care about the first post and the request for no BS...you can ask for what ever you want. Now....anybody else gonna pony up a part or two toward having a B-17 with a representative radio position? From what I've learned the radio position will be for display not a necessarily a full on operating position. That is OK in my book, better than an open hole. The op and his group can always have a radio position outside the airframe like Dave Stinson had in Texas that can be set up next to the airframe and operated where lots can see it. Anyway, I gave a grunch of radio gear to LST325 that worked because they wanted to set up an operating radio space. No probs sending some look-at ARC-5 to a B-17. Anyone else going to send some parts? Or just blab?

EdZ

Aww...that's too bad. I only saw her once back in the 80's and she
looked fine back then. I guess I should have questioned (in my mind
anyway) the wisdom of keeping her in open air beside--no, in the middle
of (Mud Island - Memphis)--the Mississippi River; but they went to a lot
of trouble to get her there. It's a shame to have abandoned the effort.

This is a case of perhaps a machine which should only be static
displayed. She's not one of the thousands of anonymous 17's remembered
only by their dwindling numbers of surviving crew; but rather a piece of
history with an unparalleled combat record at the time of her retirement.

She's done her bit...

I must say that when I ship a piece of WWII gear, I feel guilty packing it. It was designed to be shot at, go through intense cold and heat and keep working, and then I ship it off and pack it like it was a treasure. I really should tape an address label on it and drop it in the box. I doubt that the post office can do what the Germans and Japanese could not do - but I still pack the stuff with care.

But, this saving for history is a mixed bag. I have had a WERS 112 Mhz transceiver sitting on my shelf for years. It is useless. I am tempted to convert it into a working transceiver with really cute dials (and no cut holes) - but I cannot do it. So, it will sit on my shelf until I die, then be thrown out along with my 20 ARC-5s.

Holy cow, what a firestorm I've started!

In my original post, I should have included the following statement (which might have avoided this useless fight):

Please keep your opinion to yourself BECAUSE THIS IS NOT THE RIGHT FORUM FOR SUCH A DISCUSSION (on whether it's right or wrong to fly vintage aircraft, etc). I surely did not mean that we all can't have our opinions. This IS still the United States of America, and that IS still one of our most basic, cherished freedoms. I, too, would fight to the death to defend those freedoms. However, there is a time and place to discuss any topic worth discussing, and this simply isn't the place for the "fly or no fly" topic. This is a forum for discussing radios, not the politics of aviation.

Of course, hindsight is 20-20. I apologize to the group for opening the flood gates and inadvertently getting this inappropriate firestorm started.

I'll toss in my comments, since the horse has long ago escaped from the barn.

For those who believe that we should ground our B-17 to preserve it for future generations, lest it might someday be destroyed and no one will get to see one in the future, fear not. There are literally dozens of B-17s on static display all over the world. A few of those static restorations are superb (witness the USAF Museum's Shoo Shoo Shoo Baby), while a many other static planes are cobbled-together airframes that are literally rotting away on outdoor display. One need only look for static B-17s, and they'll be relatively easy to find. They're not really in short supply.

Someone mentioned seeing Memphis Belle flying back in the 1980s (I think that's what they said). Memphis Belle has not flown in decades. There is another "F" model that's painted to represent the Belle, and that aircraft is a regular flyer on the show circuit. As I recall, it's the only flying "F" model.

The comment about many vintage warplanes crashing due to poor piloting and poor maintenance is right on the

money. These old aircraft require a LOT of work to keep them safely operational, and they require a LOT of pilot skill and training to keep the pilots from making the poor decision that lead to crashes. Many groups have fallen into this category (including the mighty CAF), but that's changing. We're seeing a big trend toward proper restorations (not just patching airplanes together) and proper training of pilots and crews. The safety records are getting better (though we certainly have a long way to go). The warbird community recognizes that slip-shod restoration work ain't gonna cut it, and pilot training has become the big focus that it should have been in the past. We're not out of the woods yet, but we're a LOT better, and continuing to improve.

VFM's chief pilot (and the actual owner of our B-17) is one of the few B-17 flight instructors in the world. He's owned and flown this particular airplane since the 1970s. Our chief mechanic is a lifelong A&P mechanic (also a ham!). Our maintenance schedule is thorough and very rigorous. NOTHING comes before safety, on the ground and in the air. Our ground and air crews go through recurrent annual training and constant on-the-line training. If there's a problem, then the airplane does not fly. It's as simple as that. No airshow commitment is important enough to risk the lives of our crews or the safety of the airplane. As I stated before, the reason we don't have money to go buy vintage radios is that our money goes into the one really important thing: the airplane itself.

OK... as Ed Zeranski pointed out... the purpose of my original posting was to try to acquire original radio gear for the B-17. So far, a lot of people have come out of the woodwork to argue and fight and whine, but Ed's the only one who's actually offered to donate anything (other than myself; I donated a nice ARC5 transmitter from my own station).

As I told Ed in a private email, the chances that we will be able to put together a working station aboard the aircraft are pretty small. So far, no other '17 has a working station, though several of them have a nice set of original radios installed but not wired. We won't rule out the possibility of getting some of the gear to work (at least the BC-348-J receiver), but since all of the required wiring was removed from the airframe decades ago, it would be daunting task that would require a lot of money and volunteer hours. We prefer to spend the money keeping the airplane in

proper, safe flying condition, and using her to share
history with those who come to the museum and to the
air shows to see and appreciate it.

I said in my original post that we have a BC-348-P on
board the '17. I was mistaken. It's a BC-348-J. I
didn't have my notes handy when I wrote the post.

So... GENTLEMEN... let's halt the "fly - no fly" part
of this thread... let's agree to disagree and get back
to the original purpose. If no one is interested in
helping us out, that's fine. We will survive. Let's
just stop all of the arguing and whining. This isn't
the right forum for it. Write to the FAA and ask them
to stop allowing us to fly. Write to Air Classics and
tell the world why what we do is wrong (and yes, Mike
O'Leary WILL publish letters of dissent!). Stand out
in front of our museum entrance and hand out flyers to
our guests if you like. Let's just re-focus on radio
gear here on these newsgroups! Please?

Hello! I need a help!!
I would like to know how old are my output transformers.
One is "Stancor A-3823". Another is "Thordarson 24S33".
I have hardly tried to find out the age of trannys. However, I have
nerver had a decisive answer.

Does anyone have any idea?
If you do, Please let me know.

Thanks.

P.S. I have figured out that "Stancor A-3823" continued from early 60's
to 70's.

Well if you had asked for the radio gear without your horse shit caveat,
rules and regulation probably no one would have responded.

Anyone out there have any mods for the Swan 240. I just got one and there had been a small slide switch and a resistor added to pin 9 of the 6U8 carrier osc. I'm wondering what this mod is for.

Nels W0TUP

1550. Where does tube base master list come from?

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-03-23 15:36:45 UTC
From: "shoppa@trailing-edge.com" <shoppa@trailing-edge.com>
Message-ID: <1143128205.220956.322320@i40g2000cwc.googlegroups.com>
Source record: 12900

In my circle of tube usage, we always speak of tube bases like "6BA6 and 6AU6 both have the 7BK basing". Then I look in my oldish ARRL handbooks, find the chart of tube bases and see the 7BK pinout.

Many of the tube databases on the net use the same terminology for bases.

Obviously for the number-letter or number-letter-letter bases the number is how many terminations. And the letters seem to have been assigned sequentially (or maybe not?)

And there are some oddball bases (power tubes etc.) that don't follow the number-letter pattern but instead are simply numbers.

Is the ARRL handbook the "final authority" on tube basing, or (more likely) is this simply an excerpt from a more authoritative list somewhere else?

Tim.

The Stancor A-3823 is shown in Catalog S-103 (undated) and Catalog
S-106 dated 1961-62. It is not listed in Catalog CS-101, undated but
copyrighted 1961.

Can't help with the other one.

Perhaps it will help if you realize this is an unmoderated, free, open forum.
As such all sorts of folks lurk here. (from the bottom to the top of the scale)
Many obviously with no knowledge of warbirds and restorations there of.
The best way to avoid the "firestorm" is to ignore comments not related to your donation request.

I sincerely hope some will come forward for the radio donations, I certainly would if I had some.

This from one who flew in the 50's prop planes (Before the jets)
I fondly recall the ARC-5's, ART-13, BC-348's etc.

My Uncle flew in B-17's & B-24's in the China, Burma, India theater - he would be pleased with your efforts.
Someday his descendents will marvel that men flew in such machines.
Your efforts are a fitting tribute to the men who flew and died in these planes.

I think is admirable for you to try and put them back in their original setting - kudos and good luck
I'll spread the word here in So Calif for possible donors.

Vintage headphones came with the tip plugs. Trimm and Brandes were the most popular. My guess is you could find a set for a reasonable amount of money on eBay. You can get the pins from vintage electronic supply houses and convert more modern headsets if you so desire.

Do a search on Ebay for "vintage headphones". There are many older 'phones that will do nicely for you. Just try and ensure that they're functional and that the cotton-covered cords, etc. are not all ratted out. There are also some imported copies of the old military HS-16 up for auction from time to time. They work fine and have pin-type plugs on them. Be careful of them, though. They often go for astronomical prices due to unknowing persons.

The ARRL handbook, et al, merely mirror the information that has come out of the tube industry's long-running standards for tube bases. Your observation of the numbering system is pretty much correct. The final "authority" was probably the old RETMA manufacturing consortium that set the then-standards for tubes and many other electronic components.

Many of the older 'phones use a cloth covered "Litz" type wire. This
stuff requires crimp connectors. Trying to convert from one type of
connector to another is a nightmare! Some 1/4 in plugs are designed
to clamp the old pin connectors under screwheads.
Let me restate this a bit better. If you are looking for a set of
phones for the S-38, try to find some with the original pins on the
wires or if they have a phone plug, make sure it's the type that
utilizes the original pin connectors. Stay away from phones where
someone has removed the pins and put on a plug.

That's putting it mildly, never could get all those wires in that tip much less get them to stay. RM~

I have no doubt whatsoever. I also have a WW2 manual that includes a
section on packaging of equipment for transportation, and they don't doubt
it either:

"...It should be remembered that goods in transit receive very rough
handling, a free drop onto concrete from a height of 4' 6" is not
improbable, and packaging should as far as possible be made to meet
these conditions".

It's called 'Tinselflex' in .UK, I think, and yes: it's loathesome stuff.

I think the original (pre-crimp) termination method was to bind it to
a piece of tinned copper wire for a length of about 3/4", form the
bound-in portion into a loop to fit the screw, then bind the free to
the main part to close the loop and apply an insulating and colour coded
whipping of silk thread to stop it coming undone.

I've been known to roll it in copper foil, ram that into a crimp tah
and then squeeze as hard as possible. It usually works unless you
need a very small tag....

Chris. (At some point I've got to do 4 ends the old-fashioned way, to
repair a WS-18 Morse Key - someone chopped the loops off because they
only needed the key jack and not the Tx/Rx connector. I'm not looking
forward to this.)

Only if you use the UPS Store for the packing of the item. It seems that if the UPS Store does the packing, they indicate it on the shipping information that is supplied to UPS. That way, if there is a claim filed for damaged goods, UPS already has documentation showing that the packing job was done within their specifications. This will surely allow for quicker claims processing and less hassle for the shipper/receiver. They are reasonable with their packing rates too. I have used them for over a year now and had things shipped as far away as Australia with no problems so far.

The trick is to "whip" or wrap the ends of the tinsel wire with a small gauge solid wire. Thats not particularly easy either but it works and is neat. Working a couple inches back from the end helps a lot - then cut off the excess.

Hi,

That Swan 240 modification is described on page 29
of the manual. It disables the BFO during receive,
for improved reception of a.m.

There also should be a switch section in the cathode of V12A,
the product detector, with the addition of a 10K resistor
and 2uF electrolytic there.

UPS will lose or bust a CINDER BLOCK. I recieved an item today. Typical UPS,
the package was ripped open and it's a wonder the material was inside or
wasn't ruined/lost! I WON'T ship UPS. :(

Hi,

Just a few days left on some good stuff cheap! Low starting bids, no minimums, good feedback rating. A super chance to stock the parts bin and save space in the landfills for more deserving stuff.

Take a look at these auctions: http://search.ebay.com/_W0QQsassZkk1w2000.

Lots of old and new parts, caps, resistors, pots, coils, meters, crystals and more. Low starting bids and good feedback rating.

Thanks for looking,

Jim, KK1W

As I recall, cinder blocks were black or very dark grey. And I don't
think they were as strong as concrete blocks.

That seems to be the case (although it seems to be EIA, not RETMA for
this.)

That brings me back to clarifying my original question:

What publication has the "official master list" of EIA tube base
diagrams?

Googling around the net brought up some websites but they tend to be
LESS comprehensive than the ARRL list. (Although there are a couple of
databases like NJ7P's which have the wonderful feature of being able to
get a lit of all tubes with a given base, and there was one German
website that offered a similar feature although in a more graphical
(and maybe less useful!) form.)

I think it's possible that the number-only bases in the ARRL tables
might not be EIA.

Tim.

The A-3823 was in production much longer than that. It was in Catalog
140C, dated 10-Jul-1941.

I haven't yet been able to pin down the Thordarson part.

What about impedance matching?
Not familar with S-38 but my S-53 originally had a similar arrangement;
namely pin jacks and a small slide switch to switch from speaker to
head-phones.
That's now converted to a plug in quarter inch jack at rear of my S-53;
speaker disconnects when head-phones plugged in. But both speaker and phones
use the same output winding of the audio output transformer in the plate of
the S-53s 6K6 output tube.**
So if the S-38 is similar it suggests that the audio output is 'low
impedance'.
If someone used high impedance phones one might expect poor audio quality?
Not that high fidelity is normally a requirement when using headphones on a
shortwave 'communications type" receiver!
Or were those 'vintage' type phones that have been mentioned, in foregoing,
low/medium impedance anyway?
One reason I ask is that I have old German headphones in which, I think this
is correct, each earpiece is 2000 ohms; total 4000, probably originally for
a crystal set? I do know that you can hold one lead in hand and touch
almost anything metal with the other lead and get electrical noise!
Sensitive eh?

Impedances: Plate = say 5000 ohms. Speaker = 4 ohms. Phones = 600 ohms.
Therefore:
5000/ 4 = 1250 transformer turns ratio = sq root of 1250 = 35

5000/600 = 8.4 transformer turns ratio = sq root of 8.4 = 2.9

Actually, you don't want an impedance match here. If you matched the
impedance and put 1/2 watt or so of audio into the headphones, you
would probably burst your eardrums! Most headphones will produce
adequate audio with just a few milliwatts of power.

There are also some imported copies of the old military HS-16 up
>> for auction from time to time.

..... Some 1/4 in plugs are designed to clamp the old pin connectors
under screw heads.
Jeep and the Group...
The HS-16s work fine with the S38 and are usually pretty cheap. I bought
several from Electronic Dimensions for $5ea. The 1/4" plugs used with
tip pins are considerably larger than regular jacks. If you run across
one of the large jacks unscrew the backshell and the tipjacks might be
inside. Crimp pins from Canon MS series connectors work great on tinsel
wire and the relay jacks on back Johnson gear too.

The coordinating body for tube basing diagrams was JEDEC (Joint Electron Device Engineering Council). I have a copy of their "Publication 2B--Basing Diagrams for Electron Tubes", which covers basing assignments from "1A" to "21A", dated Sept. 1958. 46 pages worth of base drawings, and a listing of which types used each base. Updated by Lud Sibley in 2000, to include some additional background info.

The referenced standard for these diagrams is given as "EIA RS-206".

WTB: Collins R-390 spray paint
Hi
Can someone tell me where I can buy Spray paint cans to match the
front panel of the Collins R-390 Reciever?
Any local stores carry a close match??
Also is it difficult to get the panel off?
And any tips on redoing the front panel would be great.
I painted kwm cabinets before, but never did a front panel.
Thanks...Rich
ritchi50@optonline.net

ps: I see the lettering is etched in, so before I paint, do I try to
etch out all the white thats etched in, so when its sprayed I then
put in new white paint?

Not an "official" publication, AFAIK. Lud sent me a copy a couple years
ago, when a similar discussion came up on the TCA listserv.

An email and SASE to him might get you a copy, as well...

SolderSmoke!
A SHOW FOR ELECTRONICS HOMEBREWERS!

http://www.ourmedia.org/node/191977

Topics discussed in SolderSmoke #18:

-- Designing class AB amps with LT Spice
-- Solar Max and aurora in New York (1969)
-- Fishing Pole rotateable dipoles
-- Fixing HW-8 with field expedient soldering iron
-- Hack-A-Day
-- Homebrew MP-3 player
-- Shacktopus
-- Work benches
-- Mars Orbiter, Water on Saturn's moon
-- Video from Alps http://www.ourmedia.org/user/36170
-- MAILBAG: G4GOY, NT7S, Mark in NJ, Michael in
Australia, RSGB

Listen at: http://www.ourmedia.org/node/191977

Background:
Tired of listening to Led Zepplin or NPR on your
I-Pod? Wouldn't you like to be able to carry with
you the kinds of ham radio conversations that you
listen to while in your radio shack?
Mike, KL7R, in Juneau, Alaska, and Bill, M0HBR, in
London, England meet regularly on the ECHOLINK system
to discuss their homebrew radio projects. We are
making them available as PODCASTS.

You can subscribe to the program, have them downloaded
to your MP-3 player, and listen to them at your
convenience. To subscribe, just cut and paste this URL
into your I-poder (or similar) software. (There have
been some problems with this subscription URL.)

http://www.ourmedia.org/mediarss/user/36170

If you don't have an MP3 player you can just go to the
site below and listen to the latest program (and
earlier editions) using the audio software on your
computer.

http://www.ourmedia.org/node/191977

Here's the homepage for our show. All our programs are available here. There are also some videos, a blog and links to some of the sites and documents we've been discussing:
http://www.ourmedia.org/user/36170

We hope you enjoy the program. Please send us feedback.

73 from London

They had a tendency to explode if you put too much weight on them. I
put a half cinder block under a bumper jack to lift the corner of a '66
GTO and it threw shrapnel over 20 feet when it let go.

Very interesting that the post asking to stop the arguing and whining
is the longest post of all, by far. In a nutshell, that's the problem.
Only your thoughts are important, only your desires are valid, what you
want is primary above all.

As long as folks like you own these priceless relics, someday the last
one will be reduced to scrap. What a shame.

Source record: 12852

A loading coil inserted in an antenna, or a close-wound helical, can
be considered to be a transmission line. It behaves as such.

From a coil's physical dimensions, program TRANCOIL calculates the
line's distributed Inductance, Capacitance and Resistance including
radiation resistance.

Also Characteristic Impedance, Phase-shift, Propagation Velocity and
Attenuation.

Should the coil be used as an antenna, the resonant frequencies are
found, also the feedpoint impedance, R+jX, versus test frequency.

Input data can be varied via the keyboard to observe how the coil
performs versus length, diameter, number of turns and frequency.

The program is both educational and practical.

Download program TRANCOIL in a few seconds from website below and run
immediately.

The answer is still the same. If you don't want the airplane to fly then
YOU should buy it and put it on static display in your workshop.

If you don't want to buy it then let the people who are willing to
restore it use it as a flying museum.

No one is keeping YOU from gathering money for acquisition, restoration,
and floor space for a static display.

Or is it just easier for you to piss and moan about the people that are
actually doing something without any personal involvement on your part
other than your pissing and moaning?

What a ridiculous crock.

The general public was never attracted to CB. Initially it was

It is true, technology has moved on just as it always does and always will, but the CB craze of the late 70's was dead long before the technological advances you mention were developed and it had NOTHING to do with Reagan/Bush political intolerance for pete's sake.

It was a fad, mainly among teenagers, and like all fads it's lifespan was destined to be a short one.

Was it Reagan/Bush that killed the Afro hair style, bell-bottom jeans, soul music, parachute pants, etc.?

The FCC abandoned the CB service to the wolves and that's what took it over and that's what will take it over again as soon as the sunspot cycle permits.

What passing 90's fads are you going to blame on the intolerance of the Bush 43 administration?

>>i have a national nc-98. main dial cord is slipping any ideas to fixing
>>it?<<

It wasn't a dial cord but the same principal. A National NC-140 that I had picked up had a disk with a rubber coated edge that slipped inside of another disk that had a double edge on it. It was slipping real bad, couldn't hardly get it to turn. I purchased a product (think it was made by Dupont) at an automotive store intended for v belts, think it had some rosin in it. I sprayed some into a small lid then dabbed a q-tip in it and applied it all the way around that large disk.That's been 7 or 8 years ago and it's still working like new. You might give it a try before you take on re-stringing. RM~

PS, That stuff works great on air compressors and table saws also.

Yet you think *you* have the right to dictate to the people that own and
pay for those craft what _they_ "should" do with their own property.

>As long as folks like you own these priceless relics, someday the last
>one will be reduced to scrap. What a shame.

Which will have absolutely *zero* effect on the number of non-flying
"relics" on static display.

Available evidence suggests (*very* strongly, too) that "more or less
NOBODY" wants to spend the money to preserve such static non-flying
display aircraft. That *those* aircraft are being 'reduced to scrap'
today, for lack of interest. "What a shame", indeed.

Not to put too fine a point on it, how much money have _you_ donated to
the support of _any_ "non-flying B-17 static display" organization?

It's always easier to spend somebody else's money, isn't it?

I suspect the appellation 'hypocrite' applies.

> that people like you are allowed to own such an aircraft.

LOL... four words: lost ball, high weeds.
What does your above statement even mean???

FYI: Don't EVER research the film industry for any reason.

>
> A hundred or five hundred years from now, if your ilk prevails, people
> will be saying "Gosh, I wish someone had kept a B-17G preserved
> somewhere. I would have really loved to see the real thing".

Wow...? Not sure what to say to that after reading your cumulative posts.
First, please refer to the "lost ball" statement above, then
try to do some research on vintage aircraft clubs, museums, owners and
current displays.

>
> I hope and pray there are not many like you.

Plane-loads! And no thanks to you, we sit about debating whether or not a
Neanderthal with a superiority complex is a paradox.

Mister, it's painfully obvious that your intent is not to prove a point, nor
offer a reasonable debate; but to simply try and talk others down.
You must have a very hollow existence.

I hope and pray you can find a better way to spend your time.

Hi Jack,
its either slipping cause its worn (stretched) or its ppicked up some stray oil over the years. If the latter, then spary with contact cleaner to degrease - worth a try. The first - restring it. Dial cord is still available, its a tedious job beloved of apprentice radio mechanics of times gone bye....

Dave,
Everyone will have their respective opinion as to your question, and I will be no exception. Several years ago, I bought my TCS-12 system with the tuner, control box, and manual all in excellent/working condition and with matching serial numbers. There were, however, no cables nor power supply. I paid $525 for the system. If your units are in like condition, if they have not been modified, much less butchered (connectors replaced with octal sockets, etc.), perhaps the receiver would have the Navy noise limiter mod installed, maybe a crystal or two installed, and if it works (or can be readily made to work), I'd say that it could fetch... maybe $300 to the right buyer. That would be someone who's been looking for a TCS and really wants one to get on the air. If the gear is a pig-in-a-poke and there's no bona fide reason to believe they will work without any real intervention, then I'd say... perhaps $150-$200 for the pair. You could add about $40-$60 for the cables, or sell them separately, if you choose. Again, my take on the situation and the value of everything, including the cables, absolutely subject to condition.

My tech guy is over 70 and while he hates to re-string dialcords on
some sets, its the only way to go. The sprays that help "tighten" loose
dialcords are only temporary fixes and the dialcord will start slipping
again. It could be worse. NC57's are a gold-plated b**ch to re-string,
you need at least a 3rd and sometimes 4th hand to do them.

For Pete's sake...a guy puts a serious posting on here hoping to solicit genuine discussion and the comedians come out of the woodwork and booger up the thread with prattle about cinder blocks versus concrete blocks. Good grief!

Caution Mark...first, remember you pay for the UPS service and their fee is obscene. Secondly (and more important) most of the people that work in these stores are morons and provide only the most obvious preparation of your prized boatanchor. I have a lot of shipping/receiving experience and I have never seen a packing job done by one of these shippers that was equal to what someone with genuine concern would do. Most of these people are kids and...just like at McDonald's...pack by mechnical rote as to what their 21 year old supervisor taught them.

As an airline pilot I have used the freighters to commute back and forth and (as a result) spend hundreds of hours in the middle of the night waiting in large sort facilities for connecting flights. I've seen a lot and talked to many. I've seen them "free throw" packages 50 feet into cargo bins. Remember, your package means nothing to the gorillas that work in these places. Regardless of the marketing BS put out by the company.

Packaging must be such that the carton and its contents can withstand a drop from 24 inches onto concrete. If you engineer your packing with this in mind you will do far better than the simple, minded idiots that have infested American business.

RESTRINGING DIAL CORD 101

Do not be afraid. You do not need to be a college graduate to restring a dial cord. For the first few, make sure you have the instructions. SAMS is usually pretty good. it is straightforward and much easier than trying to fix a computer with some unknown virus. If you follow the instructions, it will work. I know this is difficult for some, but draw a diagram as you are taking it apart - to help you put it back together 3 years later.

Hey, you learned to drive a car, check tire pressure and scrape ice off your windshield. You can restring a dial cord.

It is not rocket science.
It is satisfying when you are done.
There are a few radios that will cause you to utter obscenities before you are through, but these are the exceptions.
Do not drink a lot of beer during the restringing - wait until after you finish. A beer or two is fine.

Please note! If you take the front panel off, you are not obligated to push the knob in until the skirts rub on the front panel. This is my pet peeve for the week. Space the skirts a nice even distance from the front panel and the radio looks much better - and give the skirts breathing room.

Get some beeswax -- available at any sewing store. Run some over
the cord. This has worked for me for years.

Thanks for the reply, $150.00 sounds like a fair average for the 3
pieces with cables. I haven't put power to the units but was able to
get around 460 volts out of the dynamotor. I don't dare go much beyond
that. 73 de N1FXX.

I recently picked up an old radio at a fest. One of its issues is that the clear plastic cover over the dial is broken as well as frosted.

I recall a web link that purported to offer tips on how to roll your own new cover, but I can't find it now. A web search didn't turn up much worthwhile.

Anyone know of a link, or how to make such a thing?

There's a Hallicrafters SX11 on ePay now, Item number: 9703933985. It has been modified and recognized by someone as such, but looks nice anyway. What would you do with this one? Try to figure out what someone else did and back out of it or just remove the mods and rebuild it according to Hallicrafters specs? Hmmmm??

I have one of those also. I am guessing that it is a low cost "toy"
microphone from the
1930's or 40'z. I seem to remember ads for that kind of equipment from
those days.
It's too "cheap" to a military mic.

I have one here. It's (I'm told) the microphone for a Victor RE57
combination
radio/phonograph/recorder, dating from 1930-31. My RE57 is a TRF radio
with capability (as implied) to play 78s and record on blank disks. I got
my mic on the 'bay for this radio.
You may find a market for these often-missing mics on
rec.antiques.radio+phono.
Cheers
Nelson

********** REPLY SEPARATOR **********

You completely missed it, Woody. My only concern here is to preserve a historical artifact which once destroyed, can never be replaced. If the current owners and future owners keep flying it around, it eventually will be destroyed. Hopefully at some point the owners will wise up and say "Enough. Lets park it before it's too late.".

My concern is as simple as that. Please do not read other motives into my posts.

General aviation doesn't need parking as far as I can tell.

The B-17G should be parked in the desert, in a hangar, where there is low humidity and no violent weather. It would last practically forever, and at five or ten bucks a ticket, would be a source of income also practically forever. And guess what... no maintenance cost either, except maybe for a feather duster now and then. :-)

1651. Plastic dial cover repair possiblity

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-03-28 07:34:32 UTC
From: Jammer <Zengmeiste@aol.com>
Message-ID: <1143531272.244862.180860@i40g2000cwc.googlegroups.com>
Source record: 12801

>Mike Coslo wrote: I recently picked up an old radio at a fest. One of its issues is that
> the clear plastic cover over the dial is broken...Anyone know of a link, or how to make
>such a thing?

Mike...

How are your woodshop skills? <g> and visualization helps here, too.

Part of the problem of old dial covers is the stuff they were made
out of just wasn't meant to last, it gets brittle, develops cracks,
yellows, and bits and pieces of it flake off. If it's intact but
yellowed, a little Brasso (the Wonder Tool, far as I'm concerned) can
get the grime and some of the yellow out, especially if it's been
subjected to the exhalations of tar-based pollutants derived from
cigarettes. <koff>

One method I've heard of (but have not actually tried meself) is to
remove the old dial cover, carefully measure the dimensions: exterior
depth, length & width, interior depth. HOPEfully it's a standard
rectangular-type cover, but this works for any shape of dial cover.

Have a buddy who's into woodworking (or a student at a local
high-school) built a wooden die-and-form in two pieces, one for the
face-side, and one for the back-side.

The face-side form needs to be wider and longer than the rectangular,
routed, hole in it by, say, three inches either way. And actually you
needn't route a rectangular hole, just find a board that's about as
thick as the outside dimension you need, cut it into four moderately
long pieces and butt them together securely to the correct length and
width; that's faster and easier to adjust as needed, rather than
re-routing another chunk.
Of course, maybe you LOVE your router; well, then route away!

The INside die needs to be just a tad smaller than the Outside form,
maybe 1/16 inch in length and width to accomodate movement of the
plastic into the space. Mount it (glue) onto a suitable backing board
to give you a good surface to push on, perhaps add a handle? of some
kind to give you a better grip.

Test the fit and adjust as needed; should not be snug, though.

Note: you could do it the OTHER way, as well: push the outside form
onto the inside die; this way you can watch as what happens

THEN.. you just need a fairly tough sheet of thin acrylic, 3 mil
thickness, maybe, or thicker.

Maybe a pair of tongs is good to have around at this point as well...to handle the plastic after heating...

Have the face-form tacked down so that it doesn't move on ya, heat the acrylic in hot, not necessarily boiling, water, grab it with the tongs, toss it onto the face form, ram the INside die into the mating hole, hold for a few seconds (minutes?) while she cools...and VIOLA!

You have a custom-made replacement faceplate for your radio, once you trim off the excess plastic. Make several, you'll never know when someone Else will want one.

This is approximately how they did it in-the-day, same as any molded piece of stuff, and approximately how it might be done. Caveat Routor.

Vinyl or other types of plastic may work as well or better; once you have the die you can experiment.

Or, instead of doing all this yourself, get the guys in woodshop / plastics to whip this up for you as an extra-credit project. It ain't hard, and it's real seat-of-the-pants repair. They might even do it for free. Maybe.

And, no, I didn't thunk this up all by myself; this was posted in an old ARCI (Antique Radio Club of Illinois) publication, I think, a LONG time ago.

Next topic: formulating, compounding, and rolling your own resistors for fun and profit!!

[NOT! but it does sound like fun....]

Hi All,

I am a SWL from India and hope to get a ticket soon. I am constructing a simple receiver and i would like to construct a good antenna for my receiver and in future for my transmitter as well. I came across a design in a souvenir released by Hamfest India where an antenna called "Pyramid Antenna" is described. The author gave reference to one design published in Radio Magazibe 1982 by Steve Bauer,DJIUS. I came across another similar design described in http://www.warc.org.uk/clubmag/qsx13.pdf . I would like to know more about this antenna and the experience of using it, about it's performance. My house is near a 11KV power line and my antenna will be less than 15 feet from the above said power line.

Thanks in advance.

Regards
Shan

I bought a National NC-300 from him on eBay a few months ago. It was basically as advertised, although I wouldn't call it "Excellent" as it was described. It definitely needed some work and was badly out of calibration and alignment. The crystal phasing capacitor was cracked, so I had to fix that, but I don't know if that happened in shipping or not. It was packed very well, in two boxes with a lot of styrofoam peanut things and bubble wrap.
It took a while for him to ship it out, but when I asked him when it was going to be shipped, he did apologize and say he had just hurt his back badly and that he would ship as soon as possible.

This is a nicely built Wattmeter project that just needs the meter to complete it. If you already have some Bird elements this would be a great item for you.

Somebody did a nice job building this. The RF coupler line section with 'N' type connectors was made by Bird Electronics and accepts the standard slugs. I connected my Bird 43 meter to the leads and tested it to make sure it is functioning.

The aluminum case measures 5" high, 4" wide and 3" deep. The meter cutout is 2-3/4" to fit a 3" meter. You would probably need a 50 - 100 uA meter or scrounge around for a Bird meter..

I am asking $55.00 plus shipping costs for this. ($4.00 - $6.00 by Priority Mail and $1.30 for insurance if desired. If interested please reply by e-mail.

73,

Michael, W1RC

It's made by Kellogg Switchboard company in Chicago. They made telephone
equipment of various grades, most of it pretty crappy. Probably this was
intended for some telephone system, possibly an operator's set.

The guys at Phoneco in Wisconsin may have the rest of the set if you want to
complete it.

1658. Systron Donner item - for Motorola

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-03-28 17:58:32 UTC
From: clfe <Nospam@clfurent.com>
Message-ID: <44297983$0$3681$ecde5a14@news.coretel.net>
Source record: 12808

Hi,

I'm looking for the operator as well as and in particular - Service Manual - for a Systron Donner made item. It was made for Motorola. It is a Frequency Counter/Deviation Meter. The tag on back with the Systron Donner name on it says model #SLN6418A 75. On the inside at the operating position - it has on top section - Motorola Frequency Counter. The bottom section says - Motorola Auto-Tune Deviation meter.

I contacted SD once and never really got a reply worth helping. A "Secretary" called me back but said she would have to refer it to someone else. I never heard back from "someone else"

Any help?

Thanks,

CLF

If it wasn't 'Excellent' as advertised; how was it 'basically as
advertised?' Sounds like a contradiction to me.

It definitely needed some work and was badly out of
> calibration and alignment. The crystal phasing capacitor was cracked,

That doesn't sound excellent at all...in fact sounds pretty bad.

It was packed very well, in two boxes with a lot of styrofoam
> peanut things and bubble wrap.

I hate the peanuts; but does sound like it was well packed...all the
more reason to suspect the 'excellent' thing.

Bill, I'm not reading any motives. I'm simply responding to your approach.
It's a bit harsh.

As others have pointed out, there are plenty of clipped wings grounded out
just as you describe.

Also, as others have said: We're getting nowhere fast, this is the wrong
group for that, and 'tis ok to agree to disagree.

However; I will concede a bit and say you can feel good knowing that if this
were the *last* B-17, I'd probably lean your way too. But it isn't the last,
and there's plenty of preserves.

What we have come to is quite simple; to collect or not to collect.... that
is the question.

The answer of course, is equally simple:

All hail the great and powerful.....*owner*.

Personal prefs aren't much for debating.... so I shall bow out.
regards,
Woody

I tried your e-mail directly but it bounced.
I seem to recall we traded e-mails several years ago.

What version of TR-1 do you have...there was a 3 unit componet version with
813 final and 811's in the modulator and a later TR-1TV cabinet rack
version.

I am still looking for a Dual Band 2 Meter/440 mobile tranceiver. It needs to have a Tone
Board so that I can access local repeaters. I am looking for something around $200. Please let me know what you have,i.e., make, model,condition, and price.
Thanks, Charlie Hugg, K5MBX

The military nomenclature is AN/URM-25F. Note that the SG-103 is
just one component of the complete set.

Hello Ken,

BAMA has a lot of the manuals that I used to have on my web site, in pdf form. But they didn't seem to put up all of them. I have lots of manuals for the URM25 generators, I've uploaded the NAVSHIPS 92495 manual and it can be found at:

http://www.ubvri.net/Manuals/NAVSHIPS92495.pdf

you probably should right click on the link and save it to your disk, the file is about 15MB.

Hi,

The URM-25 series manuals are on BAMA,
under the category "military-kg7bz".

For best download success, point your browser to
ftp://216.24.174.245/military-kg7bz/urm25

Remember: don't try to download more than one file at a time,
or BAMA will get angry at you.

73,
Ed Knobloch

Hi, Ken

That file, TM11-6625-6003-40P.pdf
is an Adobe PDF file, so DejaVu will choke on it.

It opens fine with my copy of Adobe Reader 6.0

Have a very nice condition, working (stations on all bands) Xlnt case, all dials light, no broken strings SX-28 to trade for more modern solid state or hybrid ham transceiver, quality shortwave radio, trunk tracking scanner, or ??. This thing is heavy - we'll discuss shipping costs.

This was my uncles radio and he listened to it all the time. It's been sitting for almost 2 years as I'm not a boatanchor enthusiast - although it did really sound nice when I listened to it after first receiving it.

Let me know if you have anything you'd like to discuss as a trade. Seems like a great piece of history, I just don't have a use for it...

Thanks.

>control box, and manual all in excellent/working condition and with
>matching serial numbers. There were, however, no cables nor power
>supply. I paid $525 for the system....

FWIW (not much, but I can't resist bragging), in about 1969 I purchased NINETEEN brand-new TCS-13 sets from DoD surplus sales in California for $10.51 EACH. Each part was wrapped in a multi-layer desicant-inside "sack" and they were all in a large (roughly 2x2x4 feet? It's been a long time, but my kids built really-nice "forts" out of them!) wooden box with ALL accessories except power supply: two sets of cables, control box, two keys, two mics, tuner, a bunch of spare parts such as cable sockets, mounting plates, and I don't remember what else. I sold 17 of them and still have two (although I haven't turned them on for so long that I'm afraid they my not work any longer. I later bought noise limiter kits for each and one dynamotor set just so I could say I had operated using a dynamotor!

Ham radio is FUN and it's been good to me.

But boy! TCS systems ARE boat-anchors!

From: Smokey <nospamtelegrapher@hotmail.com>
Message-ID: <122qfs8lgbgikd4@corp.supernews.com>
Source record: 12834

Looking to buy or trade toward a "Lafayette Wireless Broadcaster/Amplifier." These were marketed in 1960s as kits (Catalogue No. 19T0903) and factory built (Catalogue No. 19T0906). They were set in a small metal shadow box 4 x 8 x 5-inches and the front panel was sky blue in color. The device would allow its user to transmit to a nearby AM radio records and voice.

I built one of these in the 1960s and wish to have another to enable me to transmit old time radio shows to the vintage receivers I have around the house.

Condition is unimportant. If needing work, no problem.

I will buy outright for fair price or swap; I also have a number of nice items
that I would be willing to trade. My "tradin' stock" is probably worth more than the
Lafayette but I am no longer in need of the items and willing to dispose of them in this manner..

I appreciate your consideration. Please respond directly via email and remove NOSPAM from my email address when doing so.

Smokey

I cannot help you with this. But I _can_ tell you that in the 1990s,
Radio-Electronics had an article on building a one-tube AM transmitter
just like this. I forget what tube they used, but it was some cheap octal
type and I believe they used plate modulation. It looked like a fun and
easy project. May be worth asking the library if they can track the
article down.

I am trying to hook uo a Drake 2NT with a Heath HG10 VFO. I am using an outboard power supply on the vfo. I am getting hum and chirp on the signal. I have hooked the vfo up both for cathode keying and grid block but same results ie hum/ chirp. Anyone running this same combo? Any suggestions appreciated. Thanks-Lew K1NDV

Fun rigs. Broad as a barn, but full break-in cw. Should last forever but look out for band switch contacts. They are prone to catching and twisting all out of shape from too much contact pressure or not enough lube.

Source record: 12749

Looking to swap my Collins S-Line for something new. Not really excited about doing this, i've had this set up for 30 years. Its a 32S-1 and 75S-1. No mods, all original. 312B4 and power supply and manuals. works great. I have another S-line so this was my back up. Hasn't been on in a few years, re-capped the PS about 2 years ago.

I don't know what i'm looking for,,,something newer, computer controlled, 160M would be nice. Hope not to ship. i'll drive a fair distance to swap.

email me at KC1AT@yahoo.com

Hello:

I have an HT-32B which I purchased 6 months ago. It is too heavy for me to move around, so its been sitting in my basement, never having been on.

So it has not been fired-up. I have a manual for it also. Would deliver within 100 miles of Hartford CT. (After my son in law takes it from the basement into my car !)

I can email images to any interested party.

Will sell for best offer.

Thanks,

73, Bob

Looks like it is missing the pin plate.

The picture view shows it upside down. The three tabs bolt to a special tower base plate that is opart of the tower bottom section. The hole in the center sits on a rounded pin that bolts to the concrete.

Looks like the plate and pin are probably still on the concrete pier.

I've had a lot of response to the add for the SX-28 and most have requested photos, so I borrowed a camera and took some pics on the radio - will send upon request - I sent the batch to myself to see how long it takes and it only took about 10 seconds so it shouldn't overload anyone's server. There's about 8 shots...

Thanks.

John

Posting again due to change in photo status...

I've already had 4 requests for pics, and I don't want to spend the day sending pics so I've put the pics on a free hosting site for everyone to see. Feel free to take a look - I feel the radio is in great shape.

Any questions let me know - it played when I got it about 2 - 2 1/2 years ago and has been sitting in the closet ever since. I've been advised not to power it up again without a variac (which I don't have) so all I can say is it worked when it was put up for storage.

Have a great weekend - let me know what you have to trade, looking for solid state or hybrid ham transceiver, quality short wave radio, trunk tracking scanners, or ??? I'm just not into boatanchors.

Thanks.

From: Smokey <nospamtelegrapher@hotmail.com>
Message-ID: <122u4u9d4mfq5bd@corp.supernews.com>
Source record: 12758

Looking to swap my Hallicrafters HA-5 VFO for something...don't know what...but of boatanchor vintage. VFO is in excellent physical and electrical shape. No frequencies "weirdities" although on 80 M it drifts almost 1 kc in the first 15 minutes and then between 50 and 100 cycles per half hour after that. I have heard that is pretty standard unless you leave the VFO on all the time, which I don't after a piece of test gear I used to do that with nearly burned my house down some years ago.

If you're interested, let me know what you've got to swap. I can send you pictures via email if you wish.

Smokey

> I've been advised not to power it up

Good advice. Let the new owner risk frying the power transformer if he wants to fire it up before replacing the capacitors (see http://antiqueradio.org/halli12.htm).

At a glance, looks like it's in reasonable condition. Nitpick: missing a piece from the clutch (brake?) assembly for the main tuner in front, but aren't they all? I have two SX-28's. One is missing those parts, the other one has them.

Hi all,

The Car and Deep Cycle Battery FAQ has been updated. The current version is 5.4, dated April 1, 2006 and can be found on www.batteryfaq.org. Answers to Frequently Asked Questions, tips, manufacturer's information, references and hyperlinks are contained on this free, consumer oriented Web site about car, motorcycle, power sports, truck, boat, marine, recreational vehicle, solar, and other starting and deep cycle applications.

The most popular sections in February were:

Battery Manufacturers and Brand Names List

FAQ Section 9 HOW DO I CHARGE (OR EQUALIZE) MY BATTERY?

Section 7 WHAT DO I LOOK FOR IN BUYING A NEW BATTERY?

Battery Information Links List

Section 4 HOW DO I TEST A BATTERY?

If you have time, please visit www.batteryfaq.org. If not please bookmark it for future reference. Questions, comments and suggestions for improvement are always welcome at info@batteryfaq.org.

Many thanks and kindest regards,

BiLL.....

Source record: 12767

Here are the hard to find 2 pin microphone plugs
& panel mount connectors for boatanchor transmitters.
Mic plugs are NOS, made in the USA, sealed in the original package.
Mic plugs and mating panel mount connectors are
$5 each, $8 for a matched pair, postage included.

From: Edward Knobloch <alias@nowhere.net>
Message-ID: <ZERXf.1022$jf7.987@trndny08>
Source record: 12766

Hi, Bob

Looking at the photo of the back of the HT-32B,
it looks like the previous owner added a pair
of jacks, possibly in order to meter plate current.
If so, the appropriate meter will need to be connected
before the unit is turned on, or the 6146's will
be damaged due to excessive screen current.

73,
Ed Knobloch

I have the Heathkit Mohawk and Apache Twins in near mint condition
with original manuals. Perfect working condition.
Can any tell me what I might ask for them?
Thought about Ebay but, won't ship....too heavy.

Thanks for reading.

!00 to 200 for the Apache. The Mohawk has a bad reputation
as being a dog of a receiver. Maybe 75 to 125 for the Mohawk.
As you noted, shipping is the killer, you need a local
buyer who can pickup.

The hum may be a local problem only, and not radiated.
Have you had a local ham listen to verify that the hum
is present? A nearby receiver may hear "hum" that is
caused by RF being carried on the AC line.

The chirp could be caused by poor supply regulation,
or it could be related to the transmitter. Does the
chirp exist when the VFO is run barefoot, without the
transmitter?

One of the "great moments" of my life was watching a B-17 coming in to land at the local airport. I didn't know it was coming in,and the noise and profile when I figured out just what I was seeing was overwhelming. I'm richer for it, and so are all those who have the experience. I've seen a lot of historic planes and spacecraft in museums. They are very nice and all, but to see one actually working is orders of magnitude better an experience. Museums bear more than a passing semblance to funeral parlors. Interesting idea to store the B-17 in the desert - that is where the plane graveyards are.

I'm a machine man, and machines are made to be used IMO. I don't care if it is automobiles, trains, radios, or airplanes.

Thanks a million, Peter! That gets me started! It's a Philco 47-155 (or at least the tag said that).

It's a wood, blond, art deco style with BCB and shortwave. Most of the radio is fairly nice, but the dial cover is a disaster.

Hmmm, another 'museum' request. See 'em all the time.

So, who actually owns the aircraft? I mean when it is sold off who will get the money.

I have been approached by 'museums' for my BC-375, ART13s, 348s etc even my BC-610.

But in the end it was an individual or his kids who would finncially benefit in the end.

So where does the financial ownership of material donated utilmately end up?

Hi.

Looking for a panel meter from a Drake W-4 wattmeter. This is the same meter as used in the MN-4, MN-2000, etc.

Please reply direct.

Rick W1TY
W1TY@arrl.net

http://web.mit.edu/w1gsl/Public/flyer

*** !!!! In our Traditional GARAGE and the adjacent lot !!!! ****
so come rain or shine or super heat the Flea is on !!!

********* $1 buyers discount with hardcopy of this notice ********

COMPUTERS - ELECTRONICS - HAM RADIO - COMPUTERS - ELECTRONICS - HAM RADIO

FLEA all SUMMER at MIT
Sunday April 16th 2006
9AM-2PM

Come to the city for a great flea - plenty of free parking.

MIT's electronics and ham radio flea will take
place on the third Sunday of each month this summer,
April thru October.

There is tailgate space for over 600 sellers and
free, off-street parking for >2000 cars!

Buyers admission is $5 (you get $1 off if
you're lucky enough to have a copy of our ad)
and sellers spaces are $20 for the first and
$15 for each additional at the gate.

The flea will be held at the corner of Albany and
Main streets in Cambridge; right in the Kendall
Square area from 9AM to 2PM, with sellers set-up
time starting at 7AM.

SEASON PASS + Advance Seller Discount

A sellers discount season pass is available which
offers a 30% discount. By prepaying you get a
discount and earlier admission. See the registration form.

*** Attention Sellers ***
Prepaid vendors.. Season Pass or monthly,

will be admitted FIRST.
Separate lines will form prior to gate opening
for prepaid and nonprepaid vendors

!! RAIN or SHINE !! Have no fear of rain, a covered
well illuminated tailgate area is available for all
sellers (6'8" clearance).

Talk-in: 145.23- (PL 88.5) W1BOS/R and
W1XM/R-449.725/444.725 (PL 114.8/2A).

1755. KG7BZ Military Boatanchor Manuals now back Online

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-04-06 23:12:12 UTC
From: August Johnson <ajohn_son@ubvri.net>
Message-ID: <123b82g71b7391@corp.supernews.com>
Source record: 12705

I'm starting to upload my collection of manuals. Eventually I'll have a searchable database so you can find the manual(s) that contain a particular piece of equipment, such as a DY-8. First I'll just have the major pieces of equipment listed, such as ARC-5, SCR-274, R-390A, etc.

If you need a manual that you don't see listed, email me at the address at the top of the Manuals Page.

August Johnson KG7BZ

1756. FS: Drake TR-4CW/RIT

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-04-06 23:58:17 UTC
From: ritchi50@optonline.net
Message-ID: <ioab32l8sikpjal8g60nlgfvnjo0lhhqhb@4ax.com>
Source record: 12706

FS: Drake TR-4CW/RIT
The TR-4CW/rit was one of the last off the line, serial no. 45311, and
has the hard-to-find 34-PNB noise blanker installed, which I've seen
go separately for $200. It is extremely clean, a conservative 9+.
Flawless front panel except for one 1/8" scratch below the RIT button.
Cabinet top is perfect. Both sides are perfect except for one very
small scratch on the left side. Chassis is clean, no corrosion, no
smoke deposits. No evidence of modification. Two extra crystals are
installed for full 10M coverage.
Price: 950.00 Plus Shipping

Hello All,

There is a VLF (14 KHz) through HF (25 MHz) electro-static
shielded Active Loop antenna available on eBay right now. This is an
EMI measurement antenna that can be used for "off the air monitoring"
(providing good noise immunity for your received signals by minimizing
power line interference) as well. In case anyone is interested, it is
item # 7607202646

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=7607202646&indexURL=3#ebayphotohosting

Thanks.

Nanu

Steven, any photographic deep yellow filter will do.
May be you can find a Kodak, Ilford, or Agfa or similar brand yellow
acetate or gelatin filter.
If you cannot find a deep one, use two filters.
Ciao, Piero

You know, I almost never see any mention of a guarantee for tubes, except
occasionally on HF transmitter 'final' tubes.

That aside, it is _quite_ possible he has a tube tester. Maybe even a working
50-year old one. <grin>

Message-ID: <C2l_f.12742$gE.5188@dukeread06>
Source record: 12726

We have a very nice looking SB 200, no scratches or dings. While the cabinet has no flaws a new coat of paint on the cabinet would make this unit look awesome. I know nothing about the operation, it has been in storage for 20 years but I see nothing that looks like a melt down so am asking $150 and to be picked up in Tulsa. RM~

PS, Have photos inside and out.

1777. FS: Heathkit SB 610

This item was working fine when put into storage aprox 20 years ago. It is very clean and looks great. We have not plugged it in and recommend that it's next owner replace some caps before doing so. It will come in the original Styrofoam lined carton that Heath shipped it in.
We are asking $85 + shipping (Cashers check or Postal MO) in continental U.S.A. only.

PS, Have pictures inside and out.

From: Rob Mills <robmills@cox.net>
Message-ID: <x6l_f.12746$gE.5075@dukeread06>
Source record: 12729

This Raider has been in storage for 20 + years and needs work including re-capping. It doesn't look bad for it's age and the transformer doesn't appear to have over heated but the fuse is missing. The hv caps look like they have had it. The tubes (4 6JG6's) including the TR tube all look new and are Radio Shack brands.
Information I find on the web states that it's for 10, 15, 20 and 40 meters. The band switch markings on the front panel do not show the 10 meter position but the switch has 4 positions.
We are asking $50 + shipping (Cashers ck or Postal MO) in continental U.S.A. only . RM~

PS, Have photos

I am thinning out my radio collection, keeping only the items I really like. And, I am a big fan of the Navy version of the HRO Jr, - the National RAS. I have the radio, power supply, coil case with a matched set of coils.

I am looking for the rack, any knobs, and the speaker panel for the RAS. As I am trying to thin out my collection, I would like to trade for these items. My collection includes:

- Reciever and small transmitter components 1920's - 1950's
- Navy recievers and transmitters
- Consumer recievers 1960's and up
- Homebrew regen receivers (20's - 30's)
- Test equipment - 1950's to present.

Please email with what items you have, and let us see if we can make a deal.

David Goncalves

If I remember correctly the QF-1 needed pwr from the rcvr that came thru the octal plug. The IF signal was injected with an RCA phono plug connection. The later Q mult. had an onboard pwr supply and no octal plug cable, only the signal cable. Mike KF6KXG

1794. Replicating National RAS / HRO components

Hello,

I have a related topic concering the National RAS reciever - a variant of the early HRO made for Navy use. I have heard back from people, and would like to hear from more concerning the following:

I have been reminded that:

1. The knobs used on the RAS are the same as those used on all HROs up to the postwar era.

2. The rack used on the RAS is a relay rack, and that a suitably painted relay rack will replicate the orignal.

3. The speaker used on the RAS is the same of that used with HRO up to the portwar era, and that there is a possibility of taking a regular HRO speaker and grille, and mounting this into a suitably painted panel would replicate the original.

Has anybody experience - are the above suggestions correct?

Might somebody have spare HRO knobs and speaker that I could buy?

Untested. Very nice shape and unmolested. I don't see ant mods or repairs, extra holes etc...Front panel very nice with typical scratches on top and sides but not bad. Some minor surface corrosion on chassis but should clean up well. Its a factory painted chassis so touchup will be even easier. This will be a real nice one with some tlc. $65 + SH from 55992 @ 35lb boxed.

SolderSmoke!
A SHOW FOR ELECTRONICS HOMEBREWERS!

http://www.ourmedia.org/node/206607

Topics discussed in SolderSmoke #19:

-- Experimenter or Tinkerer? (From Bacon Bits)
-- Bill's MTP3055V FET Linear Amplifier
-- Software and Soundcards in ham radio
-- Hack-A-Day's junkbox PIC programmer
-- Mike's new shack
-- Beginner project: Michigan Mighty Mite
-- April Fools radio articles
-- MAILBAG: KB1TOM, G4GOY, G3RJV

Listen at: http://www.ourmedia.org/node/206607

Background:
Tired of listening to Led Zepplin or NPR on your I-Pod? Wouldn't you like to be able to carry with you the kinds of ham radio conversations that you listen to while in your radio shack?
Mike, KL7R, in Juneau, Alaska, and Bill, M0HBR, in London, England meet regularly on the ECHOLINK system to discuss their homebrew radio projects. We are making them available as PODCASTS.

You can subscribe to the program, have them downloaded to your MP-3 player, and listen to them at your convenience. To subscribe, just cut and paste this URL into your I-poder (or similar) software. (There have been some problems with this subscription URL.)

http://www.ourmedia.org/mediarss/user/36170

If you don't have an MP3 player you can just go to the site below and listen to the latest program (and earlier editions) using the audio software on your computer.

http://www.ourmedia.org/node/206607

Here's the homepage for our show. All our programs are available here. There is also a blog and links

to some of the sites and documents we've been discussing: http://www.ourmedia.org/user/36170

We hope you enjoy the program. Please send us feedback.

73 from London

That's a fun radio to use IF it is in working condition. No o ther radio manufacturer has made a tuning knob with that feel that is like a combination lock on the bank vault. Picked one up for $25.00 at an antique auction of all places. If they need work and alignment, according to one prior owner they can be devilishly difficult to get right.

Source record: 12677

Hi,
I have an old Signal Corps receiver- a BC-197. The serial number is 20.
I can't find anything on the web about this, except that it was part (or all)
of SCR-243. I'm just curious if anybody has any more info about it. There
couldn't have been too many of them, unless I happened upon a real early
one. Power supply info would be greatly appreciated too.

Also, I have a Collins 310B-1 which I'd love to use, but it drifts too much,
even after warm up. I replaced the entire PTO, with no effect. I've also
replaced the VR tube(s), also with no effect. I don't suppose anybody here
has had similar experiences and found a cure?

Thanks,
Dale
KJ7SL

Sorry about asking about such obscure stuff :)

1828. Solid state BFO in tube receiver

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-04-19 23:22:03 UTC
From: Antonio Vernucci <vernucci@tin.it>
Message-ID: <4446c623$0$18297$4fafbaef@reader1.news.tin.it>
Source record: 12678

Noone answered this question in the Collins newsgroup, so I try it here.

I recently inspected a Collins 75S-3B receiver, and I found that someone had modified the BFO circuit with the addition of a transistor (I have not determined whether the transistor actually replaces the BFO oscillator tube, or it instead just amplifies the BFO signal).

The receiver works fine, but I cannot figure out the reason for the modification.

I would tend to believe that:

- either it is a well known modification (but for which purpose?)
- or it was just a way to circumvent the problem of a weak BFO crystal that does not start oscillating with the BFO tube alone. As BFO crystals are not easy to find, that could be a possible justification.

Thanks in advance for any suggestion.

Back in the 70s Howard Sartori had an article published in QST concerning Solid State tube replacements. He developed a line of "tubsters" for Drake gear and later did some for Collins gear. You may just have one of his in the rig or one someone built from a construction article.

Hi, Tony

It could be that someone added an emitter follower
to the receiver BFO circuit, in order to bring the BFO
signal to the transmitter via coax. A drawback to the S/Line
is that the transmitter BFO crystal can be different
in frequency than the receiver BFO crystal due to manufacturing
tolerances, making exact zero-beating difficult in transceive mode.

I'm looking for a Hammarlund SP-600-JX-21A, the final run of the Super Pro and the only version with a product detector and selectable sidebands. Failing that, I'd be very interested in an SPC-10, the SSB adapter Hammarlund produced for the SP-600.

Please email if you have one of these, or have a line on one. I'd consider offering a very clean Hammarlund HQ-215, the company's only solid-state ham receiver and rather hard to find, in partial trade.

Thanks for your help.

Many - though maybe not all - transmits were Frequency divided by 9 or 12.
The receives used MINUS 10.7 or Minus 10.7 divided by a number. Three comes
to mind, but not sure off the top of my head (too late to think!)

IF you're in need of any crystals, I DO have some here. $2.50 each and they
were pulled from working units. I have a crystal tester, can check before
selling.
In these, the transmits were as stated above - divided by 12. I can look up
the receives.

Source record: 12688

Mostly for sake of my peace of mind, I'd like to substitute the series
current regulator tube
in my '390 with something less expensive, easier to find, and
potentially longer lived.

I could do as follows:

- rectify the AC with a diode in series with a generous drop resistor

- filter it with an electrolytic capacitor

- regulate the resulting DC with some voltage regulator of appropriate
power,
which wouldn't have to dissipate that much, as I can let the resistor
take care of much of the voltage drop

- feed the tube heaters in series just as they are in AC.

One could do all that with easily available parts.
This would also cut the inrush heater current at startup, which can't
hurt.
However, I didn't read anything so far on such a DC solution.

QUESTIONS:

- Is there any reason to avoid DC?

- What would be an appropriate DC voltage?
Is a standard 12V reg OK or should I shoot for 12.6V or what else?

It would be nice to get rid of that expensive regulator in such a
simple way. :-)

Source record: 12689

I solved this by running the 12.6VAC center tap from the power supply
to pin 5 of the regulator tube. Insert a jumper from pin 5 to pin 7
and you're in business. This also allows the jumper to be removed and
a regulator tube can still be used if you'd like.

- Is there any reason to avoid DC?

- What would be an appropriate DC voltage?
Is a standard 12V reg OK or should I shoot for 12.6V or what else

I have done that in other receivers.

Regulated dc is fine for the filaments. In theory, dc may cause the filament to wear out quicker than ac, but we are picking at straws. With dc, the electrons leave one side of the filament, while ac balances out the electron flow. I have never had a dc filament from such a regulator conversion fail, though.

12 volts is find for 2x6 volt filaments in series.

I first applied this to a Hallicrafters SX-101. That had a separate transformer for the filament and was easy. My shack was cold and I had a 120 volt heater in the shack. When it came on and off, the voltage on the filament of the oscillator changed and there was a slow drift (especially on 10 meters). Although the plate voltage was regulated, I soon realized it was the change in filament temperature that caused the drift. A secondary benefit was realized from the conversion because the hum modulation of the cathode of the 12BY7 was removed and cw signals sounded cleaner.

Source record: 12600

I want to mod my radio to use sold state rectifiers.

I read that a 220 ohm 10 W resistor is needed
to replicate the internal resistance of the rectifier tubes
and keep the voltage from rising above spec.

I assume it needs to be placed
between the diodes and the first electrolytic cap,
but I'd prefer the PS to remain a self-contained module,
so I wonder if there is any particularly appropriate
physical location w/in the PS where I could stick it
without causing too much trouble.

Any hints from experience?

Pete

The full manual for the ARC-5 range of military gear is freely
available to download from the BAMA web site.

Go to http://bama.edebris.com/manuals/military-kg7bz/arc5/

You may also find web sites that discuss modification, though these
days people prefer to keep this sort of gear in original condition.
There are also books published in the 1950s covering mods to WWII
military gear that sometimes appear on Ebay.

The transmitters normally need the control unit with HT power supply
to operate.

This UNBUILT kit is in excellent, near mint condition and appears to be complete with all documentation.

Manufactured by The Heath Company, Benton Harbor, Michigan.

$200

Includes shipping, packing and insurance in continental US via FedEx Ground. Outer shipping carton and additional packing will be supplied.

Email me if you need more details or specific information:

26Z5W rectifier tubes are difficult to obtain

Here are Chuck Rippel's comments on the subject (he made the R390A
restoration videos).
He even comments that he is willing to provide instructions to restorers.
http://www.r390a.com/html/solidstate.htm

Chuck's services
http://www.r390a.com/Services.htm

The 3TF7 Ballast tube is often mentioned for replacement -- as well.
The 3TF7 serves to regulate the filament voltage to the series-wired PTO and
VFO tubes. This design was to provide an extra level of frequency stability
to the R390A.
http://www.r390a.com/html/ballast_tube.html

Frank thanks Georgia Governor Sonny Perdue for singning a sweeping immigration bill into law. Frank argues that the law should not only apply to employees and business owners, but to politicians as well, and proposes a legal limit on the amount of wealth politicans have so that they are less corrupt and more responsive to the issues of the American people. Frank also says politicans who are pro-illegal alien, or are caught employing illegals, should be stripped of their office and immediately thrown in jail.

Frank also proposes turing the entire American population into a defacto militia, awarding an American citizen a $2000 bounty for every illegal they identify.

Also, Frank addresses the talk radio plagurists who steal his material, word for word... Lionel Richie condemned for his support of Momar Khadaffi-duck... NYC Mayor Bloomberg's heavy taxation policy driving people out of town... Bill Clinton calls in to discuss the week's events... Rush Limbaugh and don't get the Duke rape story... The politics of high gas prices... Frank explains what a "Berengian" is... your phone calls at 718-761-9996 and much more.

I recall an unbuilt Heath AR-15 kit (WORST receiver I've ever owned in my life, bar none) going for upwards of $500 a few years back. The AR-15 was beleaguered with many problems, not the least of which was a chronicly hot-running output stage due to inadequate heat sinks. The MPX circuit was notoriously flaky on my example, as well, which traced down to bad caps. Once debugged (and with a fan on its back end) it was a pretty good FM tuner with an adequately beefy power amp. Sound was....eh.

Having been taken by sellers on these Newsgroups a couple of times but have now learned how to do it. I would like to recommend that anyone that buys anything from an unknown seller on a Newsgroup to only pay via the United State Post Office "Cash (Collect)on Delivery". It only costs the buyer a few dollars but will for sure stop the dishonest sellers from taking advantage of an easy sell on a Newsgroup. Of course the exception to this rule is you know the person that you are buying from and know they are honest.

Thanks for reading,
Ron WA0KDS

You know, I'm odd enough that I know better than to question others' odd hobbies. But can somebody clue me in, because I guess I just don't get it. Where's the value in these things that make them such high priced collectibles?

If you build it, it becomes a relatively worthless piece of equipment. If you save it, you end up with a shelf full of cardboard boxes of no particular aesthetic merit. I suppose you could invest in them and flip them for higher prices but there's no fun in that. Seriously, what makes unbuilt kit collectors tick? Not judging, just really curious.

Look at the headers, dumbass. THIS Bill Turner is a regular poster on
the news:rec.radio.amateur.boatanchors newsgroup so why should he have
to change his name to please your paranoid little mind? You would have
seen that the thread is cross posted to three newsgroups, if you had
bothered to look.

Zenith bought Heathkit to become "established" in the personal
computer business to bid on a number of computer contracts with the US
military. I had the news clipping somewhere from a trade journal, but I
haven't seen it in some time.

Be careful about your Bill Turners. There are at least two of us. When
I post to a ham radio group I always use my callsign, like below. And
I haven't posted to boatanchors for a long time, if ever.

Bill, W6WRT

SolderSmoke!
A SHOW FOR ELECTRONICS HOMEBREWERS!

http://www.ourmedia.org/node/211360

Topics discussed in SolderSmoke #20:

-- Mike's rig for 80 QRP
-- Wee Willy DSB QRP rig
-- NE602s for DSB and SSB
-- QST article on Drake 2B receiver
-- Electroluminescent receiver
-- Bill's new telescope and Saturn's moon Rhea

Listen at: http://www.ourmedia.org/node/211360

Background:
Tired of listening to Led Zepplin or NPR on your I-Pod? Wouldn't you like to be able to carry with you the kinds of ham radio conversations that you listen to while in your radio shack?
Mike, KL7R, in Juneau, Alaska, and Bill, M0HBR, in London, England meet regularly on the ECHOLINK system to discuss their homebrew radio projects. We are making them available as PODCASTS.

You can subscribe to the program, have them downloaded to your MP-3 player, and listen to them at your convenience. To subscribe, just cut and paste this URL into your I-poder (or similar) software. (There have been some problems with this subscription URL -- we are working on this.)

http://www.ourmedia.org/user/36170

If you don't have an MP3 player you can just go to the site below and listen to the latest program (and earlier editions) using the audio software on your computer.

http://www.ourmedia.org/node/211360

Here's the homepage for our show. All our programs are available here. There is also a blog and links to some of the sites and documents we've been

discussing: http://www.ourmedia.org/user/36170

We hope you enjoy the program. Please send us
feedback.

73 from London
Bill M0HBR N2CQR CU2JL

I'm not in boatanchors but this has been crossposted for a long time,
which I've been more than aware of. Now it's just getting twisted like
a pretzel. And I'm leaving it that way. Maybe it will be fun watching
it unravel this time.

Bill, I have seen your post on several of the rec.radio.amateur
newsgroups over the past year, always with your call sign. Your writing
style is very different, and you don't use all caps like the other Bill.

WHAT WAS TWO YEARS AGO?????? You keep saying that, but I have no idea what in the hell you are blathering on about, as usual. No little piss ant like you is going to call me names, then tell me to shut up.

Whore? You've lived on welfare you whole useless life, and now you have the gall to call people names? Go away, Skippy. You're not wanted, you're not welcome. Get it? Go away. You are the sickest joke on Usenet, and you are back to your old tricks that got you thrown off your last ISP. Keep it up and the complaints will pour in from the same people that got your plug pulled the last time. The woman you harassed last year is still pissed at you. I just fixed her computer, and I think I will give her your new e-mail address so she can tell you off, again. She still thinks that you are some sort of a butch lesbian from the way you talked to her on the telephone.

The reason I brought it up in the first place is because OUR Bill
Turner started a thread of his own noting it and stating that "it's not
me nor is it my opinion".

Apparently HE was concerned about it and any confusion it would cause.
Maybe you killfiled him. Another reason that's a dumb idea.

I don't exactly exist for this retarded box and impotent TV mess you
know as a computer. It helps me find parts though.

Sure, all they wanted was a place to sell lots of their monitor
assemblies and complete monitors, as well as tap into government
contracts. Have you ever opened one of their TEMPEST rated CGA or VGA
monitors?

Hello, I'm restoring a Hallicrafters S-20R. I've managed to bring it back from the grave by installing new caps, a few new resistors and replacing a bad tube. Although its back to life, it still has some issues, one I hope someone here can help with. When I touch the cap of the 6K8 tube with my finger, the audio becomes much louder. Or the sensitivity increases. Not sure which. But my question is why? What should I look for in order to have the radio play at the volume without holding my finger there. It gets very boring. Any help would be appreciated.

Alignment...or if this is happening only on BCB it may be a combination
of alignment and inferior antenna.

I guess I should have also mentioned the possibility of bad rf coils since thats not all that uncommon. You'll find out during alignment if there's any bad ones.

Many of these old receivers have been zapped by a lightning charge from a nearby strike...It`s not at all uncommom to find an open RF coil in the front end of the receiver..Usually this occurs on the band that the rec is set on.Like BC band...If all bands show this condition it could be a switch problem,or something else in RF section...GL W4PQW

You're adding a capacitor between ground and part of the tube when you put your finger there. If the front end were tuned properly, this would be detuning it. But it seems like it's improving the tuning, which makes me think the tuning is way out. Look for open coils (easy to check with a continuity tester), and bad ceramic capacitors in that stage.

Just got this off ebay and am wondering how I should connect it to my Lafayette HE-10? It has the power plug, of course, and it has a coax on the back. Do I hook this up to the antenna leads? Bama just has the schematic on the site but not the manual. Any help would be appreciated.
Thank you

Hello..
Would someone please when a tube starts to exhibit 'grid leakage', what does that actually mean? What phenomena is occurring internal to the tube to force this anomaly.

Tnx...
-jim

Hi,

>Would someone please when a tube starts to exhibit 'grid leakage', what
>does that actually mean? What phenomena is occurring internal to the
>tube to force this anomaly.

It means that grid current is flowing even though the grid is
biased negatively with respect to the cathode; this is usually due
to gas in the tube. Electrons on their way to the anode collide
with the gas molecules ionising them. The positive ions so
produced migrate to the grid negating the bias and causing an
inflow of electrons. In power tubes grid current can flow if for
some reason the grid gets hot enough to emit electrons or perhaps
has become contaminated with oxide coating from the cathode.

Cheers - Joe

1914. WTB/find source for male twinlead/crystal socket connector

I am at a deadend. Have been looking for a source for male connector that is can be used for connecting a VFO to transmitter crystal socket. Clear lucite? with two pins with wire clamp screws on side. It is/was also used for connecting 300 ohm twinlead to a matching socket. Need several. I have been looking through catalogs for weeks with no luck. Any help appreciated. Thanks Ken K4KQR

Break open an old crystal. Solder some twinlead to the base.
Or call ICM and ask if they have any in stock still.

> "What do you mean there's no movie?"

First, it doesn't hook up to the antenna leads!

The outer cover of the coax goes to ground (naturally). The
center of the coax goes to either the plate of the mixer tube or
the plate side of the IF transformer. Looking at the HE-10 schematic
at the 'Bama site, the mixer tube is a 6BE6 and the plate is pin 5.
Either connect there or find the pin on the IF transformer that it
eventually goes to. Heath provided a template and RCA socket with
the kit for installation. You may want to add such a socket.

If you give me a mailing address, I can send you a (not terribly great
quality)
photocopy of the HD-11 manual.

Regards,
John

I don't recognize what the 6K8 is. Audio first stage (diode-triode)? or Mixer? A fair number of some of these tubes have, as the cap, the connection to the control grid. If its an audio tube, then you should be introducing more 60 cycle hum than anything else. When you say "the audio becomes much louder" are you talking about the audio on the signal you are listening to or background static or hum or what. I'm not at all familiar with Hallicrafters before about S-38, S-40 vintage. Give us all some more clues, and tube listing. I've read all the other responses up to the moment of writing this posting; most are worth checking out.

If the cap is the control grid of the mixer, then just maybe you are injecting--by capacitance pickup with your body (as antenna)--more broadcast RF into the circuit than is coming in normally through whatever else the input RF goes into (RF amplifier, coils, caps, whatever). In my experience, lots of times you can touch the antenna terminal of a receiver and pick up a lot of signal that would not be there if that terminal were not connected to anything.

Not sure which. But my question is why? What

The 6K8 is the converter oscillator. When I put my finger on the top
to the tube, which has a cap that runs to the tuning mechanism, the
received signal becomes louder. It seems to happen on all bands. The
lower ends of each band are affected the most. I do have about a ten
foot wire connected to the antenna terminal. I also have another S-20R
which functions normally with respect to the received signal.
I hope this is the info you're asking for. Your help very much
appreciated.

It is, indeed, the common grid connection for the triode-hexode mixer,
and I would agree that it could be RF pickup that's giving him the
extra audio output. Definitely points the finger at the RF stages
being out of alignment or otherwise faulty.

> In my
>experience, lots of times you can touch the antenna terminal of a receiver

Time for a signal generator, I suspect, and to check backwards from the
6K8 to the aerial terminal. If he's getting audio out then the IF,
detector, and audio stages are probably OK....

...oh, and check the RF stage tuning capacitor for bent/shorted plates.

Chris.

I see that rcvr has an RF amp (6sk7). What I would do is do to the plate of the RF amp, BUT THROUGH A CAPACITOR, what you did to the 6k8 grid, and don't be touching the chassis while you do it. This will give you a clue about whether there is an interstage problem. Maybe the problem is at the RF amp. Also, measure the AGC voltage on the 6sk7 control grid. If you see a voltage it will mean the coil(s) aren't open.

The schematic I downloaded is so bad I can't read the part numbers. However, there is a capacitor from the chassis to all the coils at the 6sk7 input (secondarys of the antenna transformers). You might replace it or just temporarily tack another one across it.

Tell us test equipment you have.

Don
